People who ride street cars in Evansville, Ind., are honest. This can be proved by Howard S. Butler, circulation manager of the Evansville *Courier*, a daily morning newspaper. Two or three years ago Mr. Butler installed "honor" boxes on the city street cars and on cars entering the city of Evansville. One is at liberty to take a copy of the paper and is expected to drop the money in a slot.

No one is at hand there to see that the money is deposited. It is strictly a matter of one's honor, Mr. Butler said. It is his conviction that his newspaper lost very little money on papers left in these boxes. The railways whose passenger cars carry these slot news boxes are the Evansville & Princeton, Evansville & Booneville, Evansville & Newburg and the Evansville & Ohio Valley Railway Companies.

Fare Increase Sought on Utica Interurban

A petition asking authority to increase interurban fares between Utica and Little Falls, N. Y., was filed by the New York State Railways with the Public Service Commission on Nov. 22. It alleged that the present fares are insufficient to yield a reasonable compensation for the service rendered and are unjust and unreasonable. The company claims a gross loss on the interurban line of $11,658 for the nine months ended Sept. 30, 1927.

The schedule provides for increases in one way and 50-trip ticket books both between the various stops and villages from Utica East. The special round-trip ticket rate of 6 cents in effect between the four Herkimer county villages is increased to 10 cents. The special round-trip ticket rate of 20 cents between Frankford and Forest Park is discontinued. In addition to other changes the schedule provides that tickets in strips of ten be sold for 75 cents. These tickets will be good for any 10-cent fare between stops 9 and 36.

"Enough Nickels a Day Will Help the Railway"

"Enough nickels a day will help the railway" is the slogan of Mayor Bertha K. Landes and D. W. Henderson, superintendent of the Seattle Municipal Railways, Seattle, Wash., for the little red cars which have been placed on the downtown run with a 5-cent fare for the short haul. The cars make a loop in the downtown business district. They were put into service to cater especially to the short-haul business. As indicated previously in the ELECTRIC RAILWAY JOURNAL, the first day's receipts were $61.31, the second $78.43, while the third were $95.01. When the fifth day showed receipts of more than $100, Mayor Landes became highly interested and went to the Jefferson Street carhouse to inspect the cars before they went out and to confer with Mr. Henderson.

If the 5-cent fare in the downtown loop proves successful it may be extended to other short lines. During the first week 10,306 passengers, including those riding on transfers or tokens, were carried by the loop cars.

Final Briefs in Schenectady Case

In a brief it is presenting to that body the Schenectady Railway contends the New York State Public Service Commission has jurisdiction over the matter of the fares that the railway may charge. In the brief the company also asks that the motion be denied which was made by M. P. Poersch, corporation counsel of Schenectady, seeking dismissal of the railway's petition for increased fares.

At a hearing in September, Mr. Poersch asked that the railway's petition be dismissed on the grounds that the Public Service Commission had no jurisdiction to specify fares on the lines within the city of Schenectady, since the rates were fixed by contract between the city and the company.

The railway points out that the early franchise agreement, containing a 5-cent fare provision, was superseded by others in 1911, 1919 and 1920. The 1919 ordinance authorized the commission to pass upon the company's application for an increase in fare from 5 to 6 cents; the ordinance of 1920 provided for a 7-cent fare.

At the hearing in September the commission reserved decision, pending submission of briefs.

Let the Motorman Be Your Guide

An accident for which a trolley car is responsible is a rare exception. Collisions between automobiles and the injury or death of pedestrians run down by them are so common as though it would cease to be news.

Observe the trolley motorman. He runs no risk. He does not wait for the situation of danger to arise. Before the situation is dangerous he has shut off the power.

How often do we see a motorist adopt a precautionary measure until the accident is almost too imminent to avoid.

If the motorman has an accident he must answer for it to a stern boss. The motorist may have to furnish a few explanations to a traffic judge, but the latter, a hundred to one, is a motorist himself and, at all events, such mishaps are an old story to him.

The motorist, found guilty of recklessness, seldom is penalized beyond a fine which he can well afford to pay. The motorman, convicted of gross carelessness, loses his job.

The motorman's motto is, "Safety First."

The motto of many a motorist is, "Take a Chance."—*Norristown Herald.*

Remission of Taxes in Poughkeepsie Discussed

Mayor Frank B. Lovelace said recently that if the Poughkeepsie City & Wappingers Falls Railway, Poughkeepsie, N. Y., requests the city to forego the interest and penalties on its debt, a special act of the Legislature will be required to permit the city to accept less than the full amount of the assessment bill. For this reason it would be impossible to clear up the entire matter until after the first of the year. The Mayor said it is not the purpose of his administration to attempt to settle all the matters in connection with the railway in the next month, but that he and his associates are attempting to formulate a plan and map out a course which the next administration may follow.

Without the penalties added the sum the railway owes the city is $190,000. The matter is being considered for settlement on that basis.

E. M. Dickens with Chicago Surface Lines 53 Years

For the first working day in more than 53 years Edgar M. Dickens of Chicago was not on hand on Nov. 10, when the starter down at the Chicago Surface Lines carhouse called his run. He, who is believed to be the oldest street car motorman in the United States in point of service, retired that day with the congratulations of Guy A. Richardson, vice-president of the railway. The 78-year-old railway man plans to live in California.

With a service record as old as the industry, Mr. Dickens acquired his first railway experience as a driver of horse cars in Chicago in 1873. He was assigned to operate one of the first cable cars in that city when they were put into service on the State Street line in 1881 and in 1907 was motorman of the first street car to be propelled by electric power in Chicago. Moving pictures of the aged veteran driving one of the original horse cars were taken by the *Pathe News* at the time of his retirement and shown in many local theaters.

Franchise Matter Up Again in Omaha on Jan. 15

Action on the matter of a new franchise for the Omaha & Council Bluffs Street Railway, Omaha, Neb., has been put over by the Council until Jan. 15. Meantime it is believed it will be possible to negotiate another franchise draft that will be satisfactory all around. The protective committee representing the bondholders is so thoroughly convinced of this that it is recommending that all bondholders deposit their securities so that the three years extension of the $9,000,000 issue due on Jan. 1 may be arranged.

The October report shows the company earned within $392 of its bond and other interests. Transportation revenue decreased $14,090, from $247,016 to $232,925; operating revenues from $251,615 to $237,847; operating expenses from $177,025 to $165,167, and operating income from $46,235 to $36,202. Taxes increased $6,800 for October, 1927, over October, 1926.

Minnesota Line Advances Rates

The St. Paul Southern Electric Railway, operating between St. Paul and Hastings, Minn., in the hands of a federal receiver, on Nov. 21 advanced rates and decreased its schedule. Application to the Minnesota Railroad and Warehouse Commission was not required under the circumstances. The one-way fare is 60 cents instead of 50, the round trip $1 instead of 95 cents, with ten rides for $4.50 still in force. To cut expenses the last car leaving Hastings at 9:40 p.m. is to be eliminated three days of the week and the owl car from St. Paul at 11:15 p.m. is to cease operation.

Seattle's Woman Mayor Wants Attractive Cars for Railway

While waiting to hear from the St. Louis Car Company on the deal for the purchase of 80 new cars for the Seattle Municipal Railway, members of the City Council of Seattle, Wash., are trying to find a local market for $500,000 of bonds, so that the proposed steel trestle may be built across the West Dawamish Waterway. Both the trestle construction and the delivery of new cars have been blocked pending the recent federal court litigation involving the railway. But now that a ruling has been made favoring the railway, efforts are being renewed to bring the much-needed improvements.

Mayor Bertha K. Landes has appealed to the Puget Sound Power & Light Company and J. C. Von Herberg, as a duty toward Seattle, and as public-spirited citizens, not to press further the federal court suits they brought against the Municipal Railway to determine a priority lien on its revenues. The Mayor urges both parties to announce immediately an intention not to appeal from the recent ruling favorable to the railway of Judge Dietrich of the U. S. Circuit Court of Appeals.

Neither Mr. Von Herberg nor counsel for the power company has said whether an appeal will be made, but it is considered likely that the power company will continue its case, since the company wants a court ruling which would establish a priority for the holders of the purchase bonds. If such a ruling were obtained, Councilmen declare it would virtually block further railway bond issues. All improvements to the system would increase the value of the purchase bondholders' collateral, but would not indemnify holders of bonds issued to make the improvements.

Mayor Landes approves of the suggestion of Councilman W. T. Campbell to buy street cars of greater comfort and convenience than those planned originally. She believes that the cars should contain individual seats and possibly smoking compartments. Mr. Campbell estimates the additional cost for these features would be between $1,000 and $2,000 a car.

Freight Transfer Facilities Established by North Shore

Increased facilities for receiving and handling freight have been established by the Chicago, North Shore & Milwaukee Railroad with the completion of arrangements to receive shipments at four stations of the Illinois Tunnel Company, the narrow-gage electric subway system which transports freight beneath Chicago's downtown streets. The four stations are all located in or near the Loop district and are in addition to the eight regular receiving depots of the North Shore Line, located all over Chicago.

Arrangements have also been effected whereby the North Shore Line will handle through overnight shipments to many points in Wisconsin reached by the Milwaukee Electric Railway & Light Company, the Milwaukee Northern Railroad and the Wisconsin Power & Light Company's rail lines.

The increased service is made possible through the company's new flat car-motor trailer equipment, which eliminates many handling and transfer operations, according to E. F. Weber, general freight agent of the North Shore Line.

Receivers Keep Oklahoma Patrons Informed

An interesting advertisement which follows the policy of the receivers of the Oklahoma Railway, Oklahoma City, Okla., to keep patrons informed on financial affairs of the company appeared in the Nov. 9 issue of the *Oklahoma Railwayan,* house organ of the company.

A portion of the advertisement reads:

The money you drop in the fare box is divided in many ways. Figures of the last few months show that 39 per cent of it will go to pay the salary and wages of 680 persons who are on the company payroll. Another 10 per cent goes to buy new material, while taxes and interest on indebtedness will take another 22 per cent.

Compromise Plan in Decatur Fails to Win Approval

By a vote of 482 to 291 the citizens of Decatur, Ga., have rejected the compromise plan of the Georgia Power Company and will refuse to exchange the 5-cent fare to Atlanta for a 7-cent fare and the establishment of bus lines to the Emory University and Ponce de Leon car lines. The compromise offered by the company consisted of the establishment of two bus lines, one from Decatur to the Emory University car line and the other from Decatur to the Ponce de Leon car line, with a 10-cent fare, including the privilege of transfer to the car line. It also included the payment of a $14,000 street paving assessment against the company and the promise of assistance in other paving work in return for the abrogration of the present 5-cent fare.

The Georgia Power Company has made several efforts to have the 5-cent fare agreement with Decatur abrogated without success. The Legislature has repeatedly refused to pass the necessary laws and the Public Service Commission has several times declared the affair to be out of its jurisdiction since the agreement was made before the commission was created. Once the case was carried to the United States Supreme Court, the city of Decatur winning every decision.

Officials of the company state that at a 5-cent fare the interurban line is a losing proposition and they wish to place it on a 7-cent basis along with every other line operated by the company. However, the company cannot increase the fare under the present conditions and cannot suspend service on the line.

Compulsory Savings by Utility Company Employees

A utility company in Kansas has recently taken the position that every employee in order to remain in the company's service must save at least 10 per cent of his pay. The employee is asked to fill out a card each month showing how his savings are made. Savings acceptable to the company include installments on stock purchases, savings bank deposits, building and loan payments, life insurance premiums, payments on homes, and other similarly worthy methods of saving. The rule is enforced on the theory that the man who is careful about his own affairs will be careful of the company's interests also. Payments on automobiles for pleasure are not acceptable savings.

One-Man Car Issue Acute in Des Moines

Institution of one-man car service by the receivers of the Des Moines City Railway, Des Moines, Iowa, is thought to be only a matter of weeks since C. L. Herring, receiver of the company, has said that the order of Federal District Judge Martin J. Wade undoubtedly gives the receivers power to terminate the 25-year contract between the union and the company which makes it obligatory to use a motorman and a conductor on each car.

Weight is lent to Mr. Herring's declaration by the fact that his statement was made after he recently had a session with Judge Wade. Neither Mr. Herring nor the co-receiver, F. C. Chambers, would indicate the course of action likely to be taken when asked what their plans were for an economy program.

The auditor's monthly report for October, the last full monthly period prior to the receivership, showed that the railway is going deeper and deeper in debt under its present operating schedule and fares. The debit to the stabilizing fund for October was $20,191. This makes the aggregate deficit to Nov. 1 approximately $170,000. As the receivers have promised to continue the present service and fare rate, the general supposition is that they will turn to one-man car operation to bring operating expenses within the income. November has been unusually warm, and the indications are that it will also show a deficit.

Articles in Des Moines newspapers show that more than 400 cities of the United States have either all one-man or partial one-man car service.

New Crosstown Line in Dallas

The San Jacinto and the Trinity Heights lines of the Dallas Railway & Terminal Company, Dallas, Tex., are to be merged into a new crosstown line. George I. Plummer, traffic superintendent, has issued orders on the routes.

Recent Bus Developments

Commission Approves Bus Purchase at Instance of Court

In its final order approving the petition of the Indianapolis Street Railway to purchase the People's Motor Coach Company for $500,000 the Indiana Public Service Commission expresses regret that it was not represented legally when the case came up in the Marion Circuit Court and indicates that Judge Harry A. Chamberlin was mistaken in his statement that the commission based its decisions in the case on "history" rather than on fact.

The commission's action was in compliance with the recent order of the court. The ruling followed the denial of the petition by the commission some months ago for the merger, a denial also by the commission of a petition for rehearing, appeal to the Circuit Court where a preliminary hearing was held, and a second announcement by the commission to the court reaffirming its original stand. After tracing the history of the case, the order quotes Judge Chamberlin's opinion as follows:

> The Public Service Commission presented no facts to controvert those submitted by the petitioner and gave nothing to assist the court in sustaining its findings.

In response the commission says:

> In this connection, the commission wishes to state that the Attorney-General is by law the commission's legal counsel; that the Attorney-General advised the commission that it cannot be a party in court procedure to an appeal taken from the commission's final order under the provisions of the acts of 1927 and, not being a party, cannot present facts upon its own initiative; that the commission was anxious to be present and participate in the proceedings on said appeal. The commission felt that it did not have the right to suggest to the court its willingness to take part in said proceedings and feels now that it followed properly the advice of its legal counsel.

The last order requires the motor coach company to maintain its corporate identity. The railway is directed to pay out of the operating revenues of the Peoples Motor Coach Company outstanding obligations amounting to approximately $92,000 at the time of the original public hearing before the commission. This is in accord with a contract made on March 25, 1927, between the railway and holders of common capital stock of the bus company.

Mitten Tour Terminal Moves

The Philadelphia, Pa., terminal of Mitten Tours, intercity bus operating subsidiary of the Philadelphia Rapid Transit Company, was moved on Nov. 30 from 237 South Broad Street to the ground floor of the Mitten Building, at the northwest corner of Broad and Locust Streets. With this change in location all Mitten Tours intercity buses will load and unload passengers on the north side of Locust Street, just west of Broad Street. The new terminal in the Mitten Building will provide a spacious waiting room with every provision for the comfort and convenience of passengers. Ample quarters are also provided for ticket and information desks.

All Mitten Tours buses operate from the garage located at 26th Street and Girard Avenue. Buses are dispatched from this point to the central bus terminal a few moments before scheduled leaving times. Incoming buses unload their passengers at the passenger terminal and immediately proceed to the 26th Street garage.

Buses to Replace Cars in Helena

The Helena Electric Railway, Helena, Mont., will cease to function as operator of a railway system at midnight, Dec. 31, and the Service Transit Company will begin a schedule of regular bus service over approximately the same streets now traversed by the cars. The bus firm is owned by R. P. Crago and L. F. Schroeder. This change is in accordance with the plan for the future operation of the utilities in Helena reviewed in the ELECTRIC RAILWAY JOURNAL for Nov. 26, page 1006.

Bus to Replace Discontinued Railway

The Connecticut Company has been authorized by the Public Utilities Commission to take up 1 mile of track in Stratford, Conn. Previously the commission had ordered the company to relay the track on another part of the highway to expedite the construction of a new road surface. The railway could not see its way clear to spend the $17,000 required for this work and petitioned for the right to discontinue service. The patrons in this section will be transported by bus.

Union Traction Receiver Would Enjoin Bus Company

Arthur W. Brady, receiver for the Union Traction Company of Indiana, has obtained a restraining order from the Circuit Court at Anderson, Ind., enjoining the Fort Wayne Motor Coach Company from operating a bus line along the route used by the Union Traction buses between Marion and Indianapolis, via Alexandria, Anderson, Fortville and McCordsville. The Indiana Public Service Commission, which had just issued a certificate of convenience and necessity for the establishment of the new bus line, was named defendant also. The railway considers the competition most unfair.

Would Operate Stage Line in San Diego

The San Diego Electric Railway has applied to the California Railroad Commission for a certificate of public convenience and necessity to operate Lloyd's El Cajon Stage Line, between the city of San Diego and the town of El Cajon. In a previous decision the applicant was authorized to acquire the property of this line.

Monticello Bus Line in Operation

Three new buses were placed in operation on Nov. 10 for the residents of the Monticello loop section of Clarksburg, W. Va., by the Monongahela West Penn Public Service Company.

The buses carry 23 passengers. Two of the vehicles are to operate regularly, with three during rush hours on a fifteen-minute service. These buses take the place of the car line formerly serving this section.

Decision Protects Indianapolis Company

Holding that the Indianapolis Street Railway should not be subjected to the competition of intercity bus carriers in Indianapolis streets over which the company operates lines, the Indiana Public Service Commission adopted an order Nov. 26 denying the request of the Hoosier Transportation Company for authority to receive and discharge passengers in West Washington Street. The order held that the service proposed by the bus company probably would be a convenience to the territory served, but that it was not a necessity. The bus company operates between Indianapolis and Terre Haute.

Details of Youngstown's Depreciation of Its Buses

Money has been transferred to the bus depreciation fund of the Youngstown Municipal Railway, Youngstown, Ohio, sufficient to pay for eleven buses which are still fit for service. These buses were delivered in February, March and April, 1923. They were purchased for $76,367, all of which has been transferred in monthly installments to the depreciation fund, which draws 7 per cent interest. As it is not necessary to replace the buses Railway Commissioner Engle says the $1,272 which has been transferred monthly to depreciate them now will be retained as earnings.

According to Mr. Engle there will have been transferred to the fund by Jan. 1 money sufficient to depreciate seven more buses, worth $47,551, and by Feb. 18 to depreciate six more, worth $45,554. Allowances of $792 and $759 have been made monthly to take care of these buses, which after those dates will remain in the earnings. From 4½ to 5 years is allowed for replacement of a bus, Mr. Engle said.

Financial and Corporate

Tax Issue Raised

Cities said to be concerned about ruling in San Francisco municipal railway case, reviewed by local paper

A NEW tax issue appears to have been raised. According to a dispatch to the San Francisco *Chronicle* from Washington the United States Government will not attempt to collect a tax of 13½ per cent upon the net earnings of the municipally owned public utilities of San Francisco, except its bus lines. So far as the bus lines are concerned, the government has demanded and will receive a tax payment of $900 from the city on the earnings of the municipal bus lines from July 1, 1920, to June 30, 1924. Payment will be made under protest by the city.

In response to announcement of the local Internal Revenue Department at San Francisco that it will demand a 13½ per cent tax on profits of the San Francisco Municipal Railway, the dispatch from Washington announced:

The Treasury Department has turned down cold the suggestion from Collector of Internal Revenue McLaughlin of San Francisco that the income from San Francisco's municipally-owned utilities be taxed under the income-tax law.

The *Chronicle* quoted a high official of the bureau as saying:

We will have to go over the dead body and the decisions of John Marshall, who held more than 100 years ago, while handing down his decision as Chief Justice of the United States, upon which our government today is largely founded, that the federal government has no authority to tax the states nor the municipalities and that they, likewise, have no authority to tax the federal government.

That the Internal Revenue Department in Washington has been mystified with queries relative to what the government intends to do relative to municipally-owned properties taxation, further was vouchsafed in the dispatch from Washington, which continued:

Chiefs of the Bureau of Internal Revenue have been very much mystified by a flood of queries in the last few days on what the bureau proposed to do regarding the assessment of a tax against the income from the San Francisco Municipal Railway, the Hetch Hetchy power plant and the Embarcadero bus line.

No such policy has been established for the country at large and yet the bureau was informed that Collector McLaughlin was taking steps to assess such a tax. The bureau, fearing that its San Francisco agents were about to commit a grievous error that would react adversely, immediately wired Collector McLaughlin for information.

The collector's answer was received today and merely said they were still considering the matter and were waiting for authority from the bureau in Washington before proceeding. It was intimated very strongly today that this authority will not be forthcoming.

That the matter of taxing San Francisco's municipally-owned utilities originally was brought up by McLaughlin, the dispatch from Washington said further:

The matter was brought up originally by McLaughlin, who inquired of the bureau whether he should tax the income from these utilities. Never having heard of any such suggestion before and, desiring to ascertain further information in the matter, the bureau asked McLaughlin to send copies of the contract between the city of San Francisco and the Pacific Gas & Electric Company for the sale of power for examination by its lawyers. Other documents were asked for, none of which have yet been received.

Mr. McLaughlin said that in connection with the proposed collection of a tax of 13½ per cent upon the municipally owned public utilities of San Francisco the collection of taxes on the bus lines is a matter of court record, and that the taxes shortly will be forthcoming.

The Washington dispatch, announcing the government does not intend to attempt to collect taxes on municipally-owned properties in San Francisco, in conclusion, said:

The bureau chiefs made it plain that the idea (tax collection on municipally-owned properties in San Francisco) did not originate anywhere in the Treasury Department in Washington, but came out of San Francisco and that they were merely giving the matter routine consideration and had no idea of ever giving it their approval.

Mr. McLaughlin had announced that the government's move in this city to collect taxes on municipally-owned utilities was the preliminary act in a nation-wide campaign to collect income taxes on such properties, the total of which would run into staggering sums.

Sale of Detroit United Unit Avoided

Public sale of the Detroit-Monroe-Toledo unit of the Detroit United Railway, Detroit, Mich., has been averted by bondholders who paid the state $100,000 on account of back taxes. The line was to be sold at auction on Nov. 25. Back taxes total $739,000. Bondholders are expected to petition the state administrative board to withdraw the penalty charges, leaving a net tax due of about $500,000.

Plea for North Shore Equipment Trusts Heard

A recent application of the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., for an order authorizing the issuance of $804,000 of new equipment trust certificates was heard by the Illinois Commerce Commission in Chicago on Nov. 22.

$5,000,000 Illinois Power & Light Issue Offered

An additional issue of $5,000,000 first and refunding mortgage bonds, series C, 5 per cent, 30 years, of the Illinois Power & Light Corporation, Chicago, Ill., is being offered by Harris, Forbes & Company, Halsey, Stuart & Company, Inc., Marshall Field, Glore, Ward & Company, E. H. Rollins & Sons, and Spencer Trask & Company. They are priced at 98, yielding more than 5.13 per cent. The Illinois Power & Light Corporation owns and operates electric power and light, gas, heat and city railway properties in a large number of municipalities in Illinois.

Utility Operator Takes Option on 300-Mile Steam Road

The Texarkana *Gazette* says that the Louisiana & Arkansas Railroad has been sold to H. C. Couch and associates. The price was reported to be $10,000,000, of which $500,000 has been placed in escrow with Charles S. McGain, president of the Park National Bank, New York, the balance to be paid Jan. 15.

Mr. Couch is president of the Arkansas Power & Light Company, Little Rock, Ark., controlled by the Electric Power & Light Corporation. He has long been prominent in the utility field. There has been no intimation about the ultimate disposition of the railroad soon to be acquired, but it has been indicated that plans ahead point to the ultimate electrification of at least part of this 302-mile road.

Three Merger Plans in Washington

B. McK. Bachman, chief accountant of the Public Utilities Commission of the District of Columbia, has presented a plan for consolidating the street railways of the District. According to Major W. E. R. Covell, who as acting Engineer Commissioner is also serving as a member of the commission. the Bachman plan is expected to be of material assistance to the commission in working out a merger plan to be presented to Congress. It is the only one of the three thus far projected that is before the commission in complete detail. The scheme drafted by Harley P. Wilson has been before the commission officially since Oct. 31, but it is not in complete form, and the author does not desire the commission to discuss it at public hearings until his final plan is submitted.

The third merger plan, worked out by the firm of Charles Hansel, consulting engineers and utility specialists, for the public utilities committee of the Federation of Citizens' Associations, is now being printed and put in form for publication. The Hansel plan is contained in a document of 125 closely typewritten pages and more than 100 maps, charts and plats. It is based on a comprehensive transportation survey made

Digitized by Google

by the firm's engineers, and is said to be patterned after the so-called Mitten plan, now applied to the city systems under the direction of Mitten Management, Inc.

Business Slump Hurts Youngstown Receipts

Traction Commissioner Engle has reported for the third consecutive month an actual loss in the operation of the lines of the Youngstown Municipal Railway Company, Youngstown, Ohio. The company, in September, failed by $11,009 to pay expenses, the report shows. The actual losses in July and August were $2,786 and $1,990. The company should have earned $26,738 on a 7 per cent basis in September.

Revenues slumped in September to $114,355, a $20,000 drop from the $164,958 revenue in September, 1926. While the earnings dropped, the mileage decreased about 5,000 miles, from 468,345 in September, 1926, to 463,546 in 1927.

In other months this year, with falling incomes, the mileage has been increased over the same months in 1926. Earnings for September fell off $6,000 from those in August and $9,000 from the July revenue. Mr. Engle attributes the lowered earnings to the general slump in business.

Seeks Right to Purchase Short California Line

Permission to buy control of the Petaluma & Santa Rosa Railroad, Petaluma, California, was sought from the Interstate Commerce Commission on Nov. 30 by the Southern Pacific and Santa Fe Railroads, acting jointly. The Petaluma company owns 40 miles of line and operates steamboats into San Francisco. The purchasing corporations have a contract to pay $90 a share for two-thirds of the outstanding stock of the Petaluma company.

San Antonio Preferred on Special Terms

An opportunity to purchase the preferred stock of the San Antonio Public Service Company, San Antonio, Tex., has been offered to the employees up until Dec. 15. The stock will sell at $100 a share, with payments to be made $5 a share when stock is purchased and $5 a share each month thereafter until the stock is entirely paid for. Not more than ten shares will be sold to any one person.

In the *Broadcaster*, the official publication of the company, W. B. Tuttle, president, said that he would recommend all employees who can do so to make arrangements to purchase at least one share. The company has been offering its preferred stock for local sales for a number of years, and more than $4,000,000 has been invested by people in San Antonio and the vicinity.

Receivership Lifted in St. Louis

Property there passed on Dec. 1 to representatives of bondholders following foreclosure

"ROLLA WELLS, receiver," ceased to function at midnight Nov. 30, as the United Railways' properties in St. Louis and St. Louis County, Mo., passed to the St. Louis Public Service Company at that time and the new owners are now in possession of the system. Rolla Wells, receiver, had been in charge of the lines since April 12, 1919.

United States District Judge Faris on Nov. 26 issued an order for delivering three of the United Railways subsidiaries to the St. Louis Public Service Company for operation at the end of November. Receiver Wells in accepting the order told the court he would turn over the entire system at the same time. A court order to that effect was prepared.

J. K. Newman, New York, head of Newman, Saunders & Company, and Frank O. Watts, president of the First National Bank in St. Louis, directed the reorganization of the United Railways properties.

A. L. Shapleigh, president of the United Railways, is to head the new company; Stanley Clarke, general counsel of the reorganization committee, will be executive vice-president and Sam W. Greenland will be in charge of operations.

The properties ordered turned over to the new company include the Missouri Electric Railroad, Florissant Construction, Real Estate & Investment Company and the Merchants Express Company, which operates lines between Wellston and St. Charles, Mo., and to other points in St. Louis County.

In his order Judge Faris pointed out that "there is no longer any necessity for continuation of the receivership." He conditioned the surrender of the railway properties upon the St. Louis Public Service Company agreeing to pay all debts, obligations and other liabilities incurred during the receivership.

Receiver Wells was also directed by the court to submit speedily a final report of his receivership so that the receivership can be legally terminated and the receiver discharged.

To facilitate the transfer of the system to the new owners the St. Louis Public Service Company asked the Public Service Commission that the existing fare schedule of the United Railways be filed in its name as of Dec. 1. The other application, by E. P. Walsh, president of the Missouri Electric Railroad, was for the filing in the name of that company the present fare rate schedule of the United Railways for the line between Wellston and St. Charles as of Dec. 1. No change in the fares was asked in either application.

With the receivership of the United Railways officially ended the St. Louis Board of Estimate and Apportionment is expected to give immediate attention to the adjustment of the city's $3,500,000 mill tax claim against the railway.

The city has the alternative of accepting either one-third in cash or two-thirds in the preferred stock of the new company. The city has until Dec. 15 to decide which settlement to accept. However, under its new charter it is prohibited from holding stock in private corporations.

The mill tax originally assessed against the railways was $2,396,321, but with interest the amount now is $3,500,000. The railway system was thrown into receivership shortly after the United States Supreme Court had upheld the legality of the mill tax.

Judge Faris of the United States District Court had classed the city as a general unsecured creditor. City officials have been fighting for full payment of the mill tax with interest to date.

Approximately 749,000,000 Passengers Carried in Canada

Electric railways of Canada carried 748,710,836 passengers in 1926, and the gross revenues were the largest in their history, but the majority of them failed to pay dividends. The net result of the operation of all electric railways was a deficit of $285,260, and two Ontario street railways, in Thomas and Peterboro, ceased operations.

Although the net income available for dividends and reserves amounted to $8,401,896, which was $1,678,017 more than in 1925, the total deductions were increased by $668,758, so that the net result of the operation of all railways was a deficit of $285,260, compared with a deficit of $1,294,519 in 1925.

During the year $2,647,010 was paid in dividends by six railways and $6,040,147 was charged to reserves and special charges by 45 of the railways. Of the 61 railways operated, 24 railways, after paying all charges, including dividends, showed surpluses aggregating $1,540,368 and the other 37 railways showed deficits amounting to $1,565,626.

The Montreal Tramways carried 207,754,983 passengers and the Toronto Street Railway 183,494,076 passengers. The British Columbia Electric Railway, which operates more mileage than either Toronto or Montreal, carried 74,018,102 passengers, while the Winnipeg Electric carried 57,985,144. The Hamilton Street Railway had 50,113,622 passengers and the Ottawa Railway 35,753,611. Fare passengers carried by the Montreal Tramways increased by 6,251,745, or 3.1 per cent, and the Toronto Transportation Commission's traffic increased by 2,714,136 fare passengers. The township of York and town of Weston, which handles urban traffic in the suburbs of Toronto, showed an increase of 3,059,044 fare passengers. The Winnipeg Electric showed an increase of 2,889,086 passengers, the Sandwich, Windsor and Amherstburg an increase of 2,138,548 passengers and

Digitized by Google

the Ottawa Electric an increase of 1,386,949 passengers.

With a few exceptions the interurban lines showed a reduced traffic and those which showed an increase handled a larger urban traffic, such as the British Columbia Electric, which showed an increase of 2,922,177 passengers. The Montreal & Southern Counties and Nipissing Central had heavier traffic than in 1925, but the Niagara, St. Catharines & Toronto reported a reduction of 1,069,824 passengers, the Windsor, Essex & Lake Shore a reduction of 105,437 passengers, and other interurban roads smaller reductions.

Would Permit Profit on Boston Reorganized Road

The Massachusetts Department of Public Utilities has authorized the Boston, Worcester & New York Street Railway to issue $2,066,000 of capital stock and $1,008,000 of bonds, in connection with the financial reorganization of the company. This is the successor company to the Boston & Worcester Street Railway, sold at receivership to a group of bondholders headed by Henry B. Rising, Boston. The sale price was $360,000.

In its order of approval the commission makes the following significant observation:

To permit the company to make a profit, if it is able to do it, based upon the proposed capitalization, will in no way impose an unfair burden upon the public, as the public will obtain the use of the property by paying a return on the value which is not in excess of the cost of replacing it and which is approximately $2,000,000 less than the amount originally invested therein.

We think it in the interest of the public that the property should be maintained and operated, if possible, and it is but justice to the bondholders that they be given an opportunity to recover, so long as no injustice is done to the public, the value of that which they advanced to the old company.

While there may be some possibility that some one of the public may be induced to give undue weight to the approval of this department of the capitalization in the purchase of the company's securities, we are of the opinion that under the circumstances that ought not to stand in the way of affecting the reorganization proposed.

We are not impressed with the argument that the sale price at the receiver's sale indicates the value of the property for street railway purposes. No one was in a position to bid very effectively at such a sale in competition with the reorganization committee, as it represented virtually all the bondholders who had assented to the reorganization plan, and the only effect of an increased price at the receiver's sale would have been to increase the amount of money which would be available to non-assenting bondholders who held less than 150 bonds.

The main purpose of the sale was to acquire title and to provide sufficient funds to meet the receiver's obligations. Reference was made to the sale in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 12, page 920.

$78,504 Net Profit in Mexico City

Operation of the Mexico Tramway, Mexico City, Mexico, for the year ended Dec. 31, 1926, shows a net profit of $78,504 after deductions for tax payments and depreciation. This represents an increase of $608,759 over the results obtained during the previous year, in which a heavy loss was sustained owing to a strike that took place on the property during the first two weeks in March.

In the report of President G. R. G. Conway, recently issued, it is said that the unfavorable situation in connection with the jitney continued during the year, with some slight modifications in the jitney routes and the establishment of some crosstown lines. The number of jitneys in service, however, has declined from about 2,200 in 1924 to 1,400 at the end of 1926.

During the year there was an improvement in traffic conditions and an attempt was made by the traffic department of the Federal District toward controlling and regulating the traffic in a more satisfactory manner than had been the case in previous years. The company, with a view to meeting competition, decided to make a number of changes in the routing of the cars, to put into effect a reduced fare, to enlarge the "city" zone and to suppress on certain routes the second class service. Among the proposals for meeting the jitney competition was a scheme for selling weekly tickets for $2.50 (pesos) allowing unlimited riding throughout the enlarged city zone.

During the year 35 interurban and fourteen city cars were equipped with safety doors and steps at both ends; 36 city cars were equipped with safety doors and steps on the rear end.

In Mexican currency $1,511,388 was expended during the year for repairs and maintenance. In the same period a total of $862,293 was spent on track, overhead lines and buildings. During the year $453,901 Mexican currency was spent upon new completed and uncompleted construction work and upon reconstruction work, properly chargeable to capital account.

The accompanying table shows gross earnings, operating expenses and miscellaneous information for the year ending Dec. 31, 1926, compared with the year 1925. The thirteenth annual report includes both the statement of the board of directors and the report of the president.

STATEMENT OF OPERATIONS, MEXICO TRAMWAYS

	1926 (Mexican	1925 Currency)
Car Earnings:		
Passengers	$7,483,549	$7,635,801
Monthly tickets	1,586,366	1,415,932
Chartered cars	39,378	49,251
Freight	371,576	339,050
Baggage and parcels	110,495	107,628
Funeral	182,887	211,723
Omnibus	.....	78,081
Total	$9,774,253	$9,837,468
Miscellaneous earnings	157,026	159,564
Total earnings	$9,931,280	$9,997,033
Expenses:		
Operation	$6,506,747	$6,482,819
Maintenance, taxes and depreciation	3,346,029	4,044,469
Total expenses	9,852,776	10,527,288
Net earnings from operations in Mexico	$78,504	*$530,255
Passengers carried:		
1st class	63,844,517	62,947,208
2nd class	23,090,106	22,561,126
Omnibuses	.....	510,805
	86,934,623	86,019,139
Total car mileage	18,568,009	18,090,841
Average number of passenger cars operated per day:		
Electric	389.73	379.59
Gasoline and mule cars	4.15	3.90
Omnibuses	.....	3.98
Total	393.88	387.47
Average earnings per passenger car per day	$63.86	$65.32
Average receipts per passenger car mile	.5117	.5283
Operating expenses, excluding taxes and depreciation, per car mile, passenger services	.4758	.5046
Operating expenses, including taxes and depreciation, per car mile, passenger services	.5237	.5755
Daily average earnings from operation	$27,208	$27,389
Percentage of gross expenditures, excluding taxes and depreciation, to gross earnings	89.82	92.11
Percentage of gross expenditures, including taxes and depreciation, to gross earnings	99.21	105.30

*Deficit.

Foreclosure Sought at Port Arthur

Foreclosure of a mortgage and sale of the property of the Port Arthur Traction Company, Port Arthur, Tex., is requested in a petition filed by the Dayton Savings & Trust Company of Dayton, Ohio, trustee under the terms of the indenture executed to secure the railway's first mortgage 5 per cent bonds, outstanding to the amount of $293,000. Interest on the outstanding bonds is said to be in default since July, 1926.

Portion of Seneca Falls Line Abandoned

The Public Service Commission recently granted the petitions of the Geneva, Seneca Falls & Auburn Railroad, Inc., and its receivers, Hoskins & Ryan, and approved the declaration of abandonment of a portion of its line in Seneca Falls.

It was shown by evidence at hearings and conferences that the road was operating at a loss, that foreclosure proceedings had been instituted against the company and that the abandonment of a portion of the line was proposed in the hope that savings could be made to insure partial operation.

Commissioner Brewster said that if the railroad were making a profit on the entire system, it could be held to a continuance of this line. But this was not the case and the company was faced with the determination of what was best for the public which is served by the entire road.

Legal Notes

FEDERAL SUPREME COURT — *Care Required by Truck Driver at Obscured Railroad Grade Crossing.*

The driver of a motor truck was hit by a locomotive at obscured grade crossing. He had been driving at the rate of 10 or 12 m.p.h., but had cut down his rate to 5 or 6 m.p.h. at about 40 ft. from the crossing. A good view of the track was obscured by a section house. It was daylight and the driver was familiar with the crossing. The court held: "It appears to us plain that nothing is suggested by the evidence to relieve Goodman from responsibility of his own death. When a man goes upon a railroad track he knows that he goes to a place where he will be killed if a train comes upon him before he is clear of the track. He knows that he must stop for the train, not the train stop for him. In such circumstances it seems to us that if a driver cannot be sure otherwise whether a train is dangerously near, he must stop and get out of his vehicle, though obviously he will not often be required to do more than to stop and look. It seems to us that if he relies upon not hearing the train or any signal and takes no further precaution, he does so at his own risk. If, at the last moment Goodman found himself in an emergency, it was his own fault that he did not reduce his speed earlier or come to a stop. It is true * * * that the question of due care very generally is left to the jury. But we are dealing with a standard of conduct, and when the standard is clear it should be laid down once for all by the courts. [Baltimore & Ohio R.R. vs. Goodman, 48 S. Ct., 24.]

DELAWARE — *Failure of Railroad Crossing Signal Not Necessarily Negligence.*

"While a railroad company is under no original obligation to place a signal bell, gong, or blinker light at a public crossing, yet if it has done so and has maintained the same for a long time, travelers over such crossings have a right to presume, if upon approaching said crossing the bell or gong is not ringing or the light shining, that they may pass over the crossing safely, if in the exercise of due care and caution nothing appears to the contrary. But the failure of the company to ring a signal bell at the crossing or to have the blinker lights shining or to give other due and proper warning of an approaching train would not excuse the deceased, when approaching the crossing and before going over the track, from exercising reasonable care and caution, such as an ordinarily prudent and careful man would exercise under similar circumstances." [MacRobert vs. Baltimore & Ohio Railroad, 138 At., 904.]

MISSOURI — *The Status of Person Transferring From One Car to Another.*

Street railway tracks had not been completed across a highway viaduct, and passengers were accustomed to ride as far as they could on one side, to receive a transfer, walk across the viaduct and take a car on the other side. The status of a person injured while so crossing the viaduct was held for the jury. The mere possession by him of a transfer did not necessarily make him a "passenger." [Watts vs. Fleming et al., 298 S.W., 107.]

NEW YORK — *Questions Pertinent to Be Asked by Public Service Commission.*

Under the Public Service Commission Law a witness cannot be required to answer questions unless they are material and pertinent to the purpose of the investigation being conducted. The burden of proving materiality and pertinency is on the commission. It is not sufficient that the Commission or its council deem the questions to be pertinent and legal. Questions asked of a witness as to prices paid by him for the stock of a transit corporation are irrelevant and immaterial, but questions as to the amount of stock in one transit corporation held by a competing transit corporation of which the witness was an officer and within 90 days before the investigation, were material and pertinent. A man's character and integrity are not proper subjects for investigation by an administrative body of the transit commission. [In re Dahl, 224 N.Y. Sup., 210.]

OHIO—*Conditions Under Which Supreme Court Will Reverse Commission.*

The Public Utilities Commission granted a certificate of convenience and necessity to an individual to operate a bus line without pick-up service between Steubenville and Bridgeport. The case was appealed to the Supreme Court by an existing bus line, a steam railroad and an electric railway company. The court said that it would not substitute its judgment for that of the commission as the order was not against the manifest weight of the evidence, which it did not find to be the case in this suit. [Ohio Valley Transit Co. et al. vs. Public Utilities Commission, 158 N.E., 182. (See also very similar case, Lykins vs. Public Utilities Commission, 158 N.E., 171.)]

OKLAHOMA — *Statute for Regulating the Use of Public Highways by Motor Carriers for Hire Held Valid Exercise of Public Power.*

Chapter 113 of the state laws is based on the theory that the individual citizen has no right to use the highways of the State for private enterprise to the detriment of the general public, and that where individual interest conflicts with public interest, as must be the necessary result in the use of public highways for private purposes without regulation, the government is never impotent to protect the public welfare. A private motor carrier, operating over the public highways of the state, though without regular or fixed time schedules, between fixed points in the transportation of commodities for hire under separate contracts with several business concerns, is a "motor carrier" within the meaning of the law. Hence it is subject to control and regulation by the provisions of the law. The case is differentiated from Frost vs. California Railroad Commission, as decided by the United States Supreme Court. [Barbour vs. Walker, 259 P., 552.]

PENNSYLVANIA — *Railway Not Responsible When Sharp Heel of Woman Passenger Is Caught in Groove of Curved Rail.*

A woman passenger after alighting from a car caught the sharp heel of one of her shoes in the groove of a curved rail. The groove was of the customary size, i.e., 1⅛ in. wide and 1¼ inches deep. The plaintiff had not asked to be assisted while alighting. The railway was held not responsible. [Low vs. Harrisburgh Rys., 138 At., 852.]

TEXAS—*Duty of Motorman to Automobile Stalled on Track.*

To make a railway company responsible where a motorman ran into an automobile stalled on the track, "it must appear that the driver of the street car actually saw the automobile on the track, and knew and realized the danger to its occupants in time to have, by the use of the means at hand, consistent with the safety of the street car, avoided the collision, and then failed to do so. If he had no such knowledge, the doctrine [of discovered peril] did not apply, although it appeared that by the exercise of ordinary care he might have acquired same." [Eastern Texas E. Co. vs. Smith, 298 S.W., 314.]

WASHINGTON—*Right-of-Way at Crossing Defined.*

Under the state law, street cars have a right-of-way at street intersections over other vehicles simultaneously approaching such intersections. Such right-of-way, however, must be exercised with care and with due regard to the use of the street by others. [Lung vs. Washington W. P. Co., 258 P., 832.]

Personal Items

G. H. Conklin Heads Carolinas Bureau

George H. Conklin, whose election as secretary and treasurer of the North and South Carolina Utilities Information Bureau was announced in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 26, has been affiliated with the Augusta-Aiken Railway & Electric Corporation, Augusta, Ga., since 1891. From a college in Kansas he went to Augusta as secretary to the then president, Col. D. B. Dyer, who built and operated the road, with Jarvis and Conklin as partners, until they sold it in 1902. Mr. Conklin has served in nearly every department incident to the business and has been in charge of the claims department for the entire 36 years. During this time he has served with a half dozen ownerships and fifteen different managers. For the past eight years Mr. Conklin has been devoting his time and attention especially to publicity and safety, having helped to organize the safety organization.

His present title is director of public relations. As secretary and treasurer of the North and South Carolina Utilities Information Committee, to which position he was elected at the recent meeting in Charlotte, he succeeds Raymond Hunt, vice-president of the Tidewater Light & Power Company at Wilmington.

Mr. Conklin is a member of the Georgia Manufacturers Association, the Utilities Information Committee of Georgia and the Board of Commerce.

New Resident Vice-President of Pennsylvania in New York

George Le Boutillier, vice-president of the Long Island Railroad, was elected on Nov. 23 to the newly created position of resident vice-president of the Pennsylvania Railroad in New York City. This step has been taken in order that the Pennsylvania Railroad may be more adequately represented in the largest city of the country by an officer of executive rank. Mr. Le Boutillier, in his new capacity, will be in a position to deal with the questions arising at New York authoritatively as a Pennsylvania Railroad senior representative in New York City. He will also continue to serve as vice-president of the Long Island Railroad, but will, however, be largely relieved of operating details by reason of the recent appointment of R. K. Rochester to the position of general manager of the Long Island Railroad. Heretofore Mr. Rochester was assistant general manager of the Pennsylvania Railroad, stationed in New York City. As general manager of the Long Island he will personally direct its operations.

The board of directors also transferred William U. Moyer, assistant to the president and now stationed at Philadelphia, to New York City.

Mr. Le Boutillier has been in the service of the Pennsylvania Railroad for 32 years. In 1920 he was appointed general superintendent of the Eastern Pennsylvania Division, with headquarters at Harrisburg, Pa., and in 1923 was transferred to the Long Island Railroad as vice-president.

J. F. ORR, sales manager of the Idaho Power Company, has become manager of the Ogden division of the Utah Light & Power Company at Ogden, Utah. He had been engaged continuously in one field of service eighteen years.

T. F. DREW has resigned as president of the Middlesex & Boston Street Railway, Newtonville, Mass., and H. H. Hanson was elected in his place. J. L. Richards resigned as chairman and Mr. Drew was made chairman.

Friends Honor W. H. Sawyer

New president of Stevens & Wood welcomed back to New York at testimonial dinner on Nov. 28

W. H. SAWYER, recently elected president of Stevens & Wood, Inc., New York, was the guest of honor at a testimonial dinner at the Engineers Club, New York, on Nov. 28, arranged by a group of his friends in the railway and utility business so as to welcome "Bill," as he is best known among them, back as a resident of New York. The guests included men high in the councils of the utility business, whose contact and friendship with the new Stevens & Wood executive date back many years.

W. H. Sawyer

Little time was spent in dwelling upon Mr. Sawyer's ability as an engineer and an executive. His business record was so well known to those who attended the dinner that speakers confined their remarks largely to their impressions of their guest as a man and a friend. These testimonials threw into relief the many sterling qualities which have won for Mr. Sawyer a country-wide reputation for straightforward dealing, honesty of purpose and unflinching courage, tempered with tolerance and broadminded acceptance of an opposing point of view.

J. N. Shannahan, past-president of the American Electric Railway Association, acted as toastmaster. He said that it seemed eminently fit that a dinner to Bill Sawyer should be confined to a small group of personal friends, because loyalty to his friends has always been one of the outstanding characteristics of the guest of honor. Other speakers included Charles Gordon, speaking for James H. McGraw; F. R. Coates, Frank Hedley, R. P. Stevens, L. S. Storrs, T. A. Kenny and Mr. Sawyer.

Several speakers characterized Mr. Sawyer's service to the industry during the past year as president of the American Electric Railway Association as an outstanding achievement, since he had devoted himself unstintingly to the task of arousing local transportation men to an adequate appreciation of present-day public demand by preaching the gospel of a new day, of new conditions and of new demands upon the industry. The result of that work was evidenced by the Cleveland convention, with its dramatic revival of spirit and enthusiasm among manufacturers and operating executives.

ACTIVE EXECUTIVE WITH BROAD TRAINING

In commenting on Mr. Sawyer's accession to the post of president of the Stevens & Wood organization, R. P. Stevens, now chairman of the board, said that the move was dictated by the expansion of the firm's business and the need for an active executive of broad training, foresight, courage and winning personality.

After he was graduated from the University of Nebraska Mr. Sawyer had nine years of diversified experience with the General Electric Company. He then became engineer in charge of the New York office of Ford, Bacon & Davis, where he served for another nine years.

In 1914 the E. W. Clark & Company Management Corporation elected him to the position of vice-president, in which post he broadened his experience in utility management, engineering and construction. Then as president of the East St. Louis & Suburban Railway and affiliated properties for the North American Company Mr. Sawyer established a country-wide reputation for progressiveness in the face of difficult circumstances.

A great compliment was paid to his business and engineering ability when

Digitized by Google

in 1925 Mr. Sawyer was retained by the Victorian Government of Australia and appointed a Royal Commissioner to inquire into and report upon the status and affairs of the Electricity Commission of Victoria, and especially as to its power generation and distribution. He obtained a leave of absence from the North American Company to undertake this work, which was accomplished with great success.

John W. Hancock Heads Virginia Association

John W. Hancock, general manager of the Appalachian Electric Power Company, Charleston, W. Va., was elected president of the Public Utilities Association of Virginia at the recent annual convention. In this capacity he succeeds William E. Wood, Richmond, president of the Virginia Electric & Power Company.

For many years Mr. Hancock has been affiliated with the Roanoke Railway & Electric Company, which is controlled by the Appalachian Electric Power Company. In 1913 his duties were extended to include the property of the Lynchburg Traction & Light Company, Lynchburg, Va. He entered the service of the Roanoke Street Railway in 1895 and was appointed general manager when the company was reorganized early in 1900.

Mr. Hancock was born in Franklin County, Virginia, and has lived in Roanoke since 1890. Once before, in 1913, he served as president of the Public Service Association of Virginia. He is a member of the American Institute of Electrical Engineers.

Personnel Changes on Northern States Property

George H. Wilmarth, division manager of the Northern States Power Company, Eau Claire, Wis., has been appointed chief operating engineer with headquarters at Minneapolis. Mr. Wilmarth removed from Oklahoma to Wisconsin in 1923, when the Byllesby interests, with which he had been connected since 1910, acquired the Wisconsin-Minnesota Light & Power Company. He was formerly manager of the Oklahoma Gas & Electric Company at Sapulpa and in 1918 became manager of the Muskogee division. This position he occupied until 1923, when he was made vice-president and general manager of the Wisconsin-Minnesota Light & Power Company. Mr. Wilmarth succeeds M. L. Hibbard, who has resigned to accept a similar position with another company.

Harold L. Geisse succeeds Mr. Wilmarth. In addition to his duties as manager of the Wisconsin division, he will continue as general manager of the Wisconsin Valley Electric Company and affiliated companies with headquarters at Warsaw. This position he has occupied since 1921.

E. L. Graumlich Commissioner at Toledo

Has been acting street railway commissioner in Ohio city for three years. Graduate engineer

E. L. GRAUMLICH, acting street railway commissioner at Toledo, Ohio, for more than three years, was permanently appointed commissioner by Mayor F. J. Mery on recommendation of the Board of Street Railway Control during the week ended Nov. 26. The Mayor stated that Mr. Graumlich had served "loyally and well and deserved the appointment."

Mr. Graumlich went to Toledo as engineering assistant to Commissioner Wilfred E. Cann early in February, 1921, when the present Milner service-at-cost ordinance went into effect. After Mr. Cann resigned as commissioner he continued to fill the vacancy and work with the board of control through the last three years.

E. L. Graumlich

He was graduated from Fostoria high school and took his engineering training at Case School of Applied Science, Cleveland, from which he was graduated with the class of 1918. Immediately thereafter he entered the World War service as an officer in the Coast Artillery. Previous to his graduation Mr. Graumlich worked with Fielder Sanders, then street railway commissioner in Cleveland, and it was on the basis of this experience that he was brought to Toledo.

Engaged on Several Surveys

Mr. Graumlich also did considerable work in rapid transit surveys in Cleveland and Detroit under the direction of Parsons, Klapp, Brinckerhoff & Douglas, New York. Since he has been in Toledo he has been consulted by many railway engineers from various cities anxious to study electric railway practices in Toledo.

The appointment was considered timely, particularly since there is the possibility of a change in the commissioner's office due to the progress made in the last year of negotiations toward a new railway franchise ordinance. Mr. Graumlich has been the technical adviser of the City Council and Street Railway Board of Control in all these matters. There will probably be no change in complexion of the board, at least, until February, 1929. This promises to keep intact the administration of the board and its staff through negotiations now in progress.

OBITUARY

Charles B. Manville

Charles B. Manville, 92 years old, founder of the Johns-Manville Company, died at his home in Pleasantville, N. Y., on Nov. 27. He had been ill only a few days.

When Mr. Manville retired from the Johns-Manville Company many years ago, the late Thomas Franklyn Manville, his son, became president, and upon his death the reins were taken over by another son, H. Edward Manville, who was in control until last May, when he resigned the presidency to become chairman of the board of directors of the company.

Born in Watertown, N. Y., Dec. 16, 1834, Mr. Manville emigrated to the West in one of the many pioneer waves prevalent in the '40s. He stopped in Wisconsin and there found deposits of asbestos which he developed into insulation and roofing materials and thereby laid the foundation for the company which still bears his name. He and his sons virtually acquired a monopoly on the asbestos field when they gained control of the mines in Ontario, the chief source of the mineral.

William Carpender, formerly president of the Sixth Avenue Railway, New York, N. Y., died in that city on Nov. 26. He was a financial figure in Manhattan for many years. In 1918 he was elected president of the Sixth Avenue Railway, which later became part of the New York Railways. In this capacity he succeeded the late Frank Curtiss. Mr. Carpender was 84 years old.

William P. Bonbright, founder and for many years president of the banking house of Bonbright & Company, died Nov. 10 in Roosevelt Hospital, New York. A native of Philadelphia, Mr. Bonbright entered upon his career with Hood, Bonbright & Company of that city in 1876, six years later being admitted to partnership. It was in 1920 that he retired from the presidency of Bonbright & Company, New York. This company under the leadership of Mr. Bonbright rapidly forged to the front of investment banking firms and was a pioneer in light and power securities. It has co-operated closely with the electrical industry during its development and has made notable contributions to its progress through the Bonbright survey and the Bonbright prize awards. Mr. Bonbright had many friends among utility executives and has always been an enthusiastic advocate of the utility industry. He was 68 years of age.

Manufactures and the Markets

Three Car Orders Contained in Recent Reports

Twenty-four new cars intended for two Canadian companies. New York company orders twenty subway cars

NEW car orders by the Toronto Transportation Commission and the Quebec Railway, Light & Power Company for fourteen and ten cars respectively are mentioned in recent reports. An order for twenty subway units has already been placed by the Hudson & Manhattan Railroad.

Eight combination passenger smoking and baggage compartment cars and six straight passenger cars with smoking compartments for the Toronto Transportation Commission are to be used in interurban service out of Toronto. While the cars are designed for single-end operation provision is made for operating them from the rear end in an emergency Passengers will enter and leave through the rear door only The smoking compartment will be ahead of the passenger section. Cars will be trimmed in African mahogany and genuine leather-upholstered seats, which are semi-divided, will be used. Between certain of the seats a card table can be placed for use of passengers on long trips.

The Quebec Railway, Light & Power Company, Quebec, Canada, intends purchasing ten double-truck, one-man, two-man cars for delivery next May. The cars will be 41 ft. long and will have a seating capacity of 45 passengers. In general design they will be similar to those now operated by the Montreal Tramways, Montreal, Canada.

An order for twenty subway units was placed last week by the Hudson & Manhattan Railroad, New York, with the American Car & Foundry Company.

Second International Coal Conference Will Be Held

From the Carnegie Institute of Technology in Pittsburgh comes an official announcement that a second International Conference on Bituminous Coal will be held there during the week of Nov. 19, 1928.

Gary Railways Receives Last of Sixteen Remodeled Cars

The last of the sixteen side-entrance cars formerly used on Broadway have been received by the Gary Railways, Gary, Ind., from the Cummings Car & Coach Company, Paris, Ill., where they have been remodeled into front-entrance cars with automatic doors, conforming to the type now being used generally over the lines of the company. Workmen have begun the final half of the reconstruction work on the company's North Broadway loop, where concrete pavement is being laid between the tracks; the first half of the $25,000 project was completed a short time ago, opening the northbound tracks for use. Completion of another improvement project, installation of a sprinkler system in the car shops, was also announced.

One of Georgia Power's New Units Run on Peachtree Street

One of the 40 new all-steel cars ordered by the Georgia Power Company, Atlanta, Ga., has recently been placed in service on the line running on Peachtree and Whitehall Streets. Seating plan, elevation and preliminary specifications were published in the JOURNAL Aug. 20. Most of the new cars have been delivered and the balance at that time were being received at the rate of one or two weekly, according to officials of the company.

New Locomotive Soon Ready for Indianapolis-Eastern Road

A new electric locomotive built at the Greenfield shops of the Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., was recently taken through Indianapolis to the paint shops of the company at Crawfordsville to receive the finishing touches. The engine, which will be brought to Indianapolis soon to be on exhibit for a day at the traction terminal station, is said to have ten times the tractive power of the average electric car and will be used exclusively for freight haulage.

V.E.P. to Start $85,000 Job Early in 1928

Street railway tracks of the Virginia Electric & Power Company on Granby Street, between Queen and Main Streets, Norfolk, Va., will be reconstructed early next year at a cost of about $85,000, officials of the public utility company disclosed. The company is obligated, it is understood, by franchise requirements to repave between its tracks and 2 ft. on either side of them. The city of Norfolk is said to be considering repaving the street at the same time the Virginia Electric & Power Company is doing its work. City officials admit that Granby Street paving is in bad condition, it is reported, but are worried about the large slice of the small bonding margin which the improvement would absorb.

The $5,000,000 addition to the Reeves Avenue power plant will be opened early in December, according to an announcement by Thomas P. Walker, vice-president at Norfolk.

W. H. Woodin Again Heads American Locomotive Company

William H. Woodin, head of the American Car & Foundry Company, and chairman of the American Locomotive Company board of directors, was for the second time in the space of two years elected to the presidency of the American Locomotive Company, at a recent meeting of the board of directors, to succeed the late Frederick F. Fitzpatrick. Mr. Woodin's various connections with the company are, elected a director in 1919, president in 1925, chairman of the board of directors in 1927. In 1926 he resigned the presidency in favor of the late Mr. Fitzpatrick.

Permit Issued at Coral Gables to Build Municipal Carhouse

Issuance of a building permit at Coral Gables, Fla., for the first unit of the municipal carhouse, to be constructed at 134-146 Muertes Avenue, took place recently. It is understood the structure will cost about $20,000.

Copper and Lead Prices Advance in Active Metal Market

Sales of practically all metals have been phenomenally good all month and prices of copper, tin, lead and zinc have advanced as a result. Copper has done particularly well, advancing ⅝ cent during the month. Lead and zinc dropped to new lows early in November, but have since more than made up the loss. Tin has been irregular, but is 1½ cents higher today than on Nov. 1.

Until Nov. 29, copper sellers generally adhered to the 13¾ cents level in the East and 13⅞ cents delivered in the Middle West, with some offerings and sales at 2½ to 5-point concessions in the East. Business Nov. 29 was so large, however, with two or three particularly heavy orders, that an overnight advance was general. On Nov. 30 sales had been made all the way between 13.80 cents delivered in the East to 14 cents in Detroit and other Mid-Western territory.

The foreign market has also been strong, and the price was advanced from 14.05 cents, c.i.f. to 14.15 cents Nov. 30.

The last week has been a quiet one for zinc, following a more active week than any other in a year or more. Prices have been well maintained at around 5.85 cents for December shipment, however, and somewhat higher for deliveries further forward. On Nov. 30 little interest by consumers was reported, but with the higher prices asked for concentrates in the Tri-State district smelters are holding firm. High-grade continues nominally at 7¾ cents delivered in the East for spot carloads. Prime Western in New York is at the customary freight differential of 35 cents per 100 lb. above St. Louis.

After maintaining its New York price for common lead at 6.25 cents per

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINERY

Metals—New York	Nov. 29, 1927
Copper, electrolytic, cents per lb.	13.525
Copper wire, cents per lb.	15.50
Lead, cents per lb.	6.41
Zinc, cents per lb.	6.237
Tin, Straits, cents per lb.	59.125
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.075
Somerset mine run, Boston, net tons	1.85
Pittsburgh mine run, Pittsburgh, net tons	1.825
Franklin, Ill., screenings, Chicago, net tons	1.55
Central, Ill., screenings, Chicago, net tons	1.325
Kansas screenings, Kansas City, net tons	2.125
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	5.50
Weatherproof wire base, N.Y., cents per lb.	16.25
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	10.6
White lead in oil (100-lb. keg), N. Y., cents per lb.	13.25
Turpentine (bbl. lots), N. Y., per gal.	$0.55

pound for eleven weeks—since Sept. 9, when the price was cut from 6.40 cents—the American Smelting & Refining Company on Monday, Nov. 28, advanced its official quotation $1 per ton to 6.30 cents, and the next morning made a further advance to 6.40 cents. Several good sales have been made at 6.45 cents on Nov. 29 and 30. The St. Louis market was even more active than that in the East, and the price was marked up during the week from 6.075 cents to 6.22½ cents. Corroding grades of lead are commanding the usual premium of from $2 to $3 per ton.

Backing and filling have characterized the tin market during the week. London on Nov. 29 ignored a decline in the New York market on the preceding day, and as a consequence the domestic prices stiffened again. Dealers have traded actively, but consumers likewise have been in the market. Prompt Straits is not overly plentiful, and it commands a premium, though very slight, over forward positions.

Rubber and the Trade Balance

Rubber continues to play an important part in determining whether the foreign trade balance of the United States shall tilt upward or downward. An analysis of international trade of the United States for the first six months of 1927, made by the Department of Foreign Commerce of the Chamber of Commerce of the United States, shows that while exports increased, as compared with the similar period of the previous year, imports declined.

Of the total decrease of $178,000,000 in import values $137,000,000 is accounted for in the heavy decline in crude rubber prices. While rubber was slipping, silk went into the ascendent, taking first place in the rank of imports. In its analysis the department said:

> The average price of raw silk in the first half of 1927 was 65 cents a pound lower than in the same period of last year, and our imports reached the record total of 35,246,000 lb., valued at $193,385,000, a 25 per cent increase in quantity and an 11 per cent gain in value over last year's figures. The price of crude rubber declined 33 cents a pound and we imported nearly 500,000,000 lb., with a total value of $184,713,000, an 8 per cent gain in quantity, but a 43 per cent decrease in value.

ROLLING STOCK

TRI-CITY RAILWAY, Davenport, Ia., it is reported, has purchased at a cost of about $46,000 five Mack six-cylinder, 29-passenger motor coaches, which will be placed in service as soon as delivery on the order can be made. Two of the new coaches will take the place of the old coaches now operated on the 23d Avenue line in Moline and the three others are to be put into service on the Arsenal coach line, the new short cut to Moline from Davenport. It is probable that the Arsenal line will not be in operation until Jan. 1.

TRACK AND LINE

PHILADELPHIA RAPID TRANSIT COMPANY, it is reported, will install an electro-pneumatic interlocking plant for emergency operation at the Allegheny avenue station, on the Frankford elevated division. The interlocking machine will consist of eight working levers, four of which will be employed for traffic locking between adjacent towers and the others for operating the switch movements, electro-pneumatic train stops, light signals, etc., of the plant. All the interlocking apparatus is being furnished by the Union Switch & Signal Company, while the construction work will be carried out by the Philadelphia Rapid Transit Company's regular field forces.

SHOPS AND BUILDINGS

GRAYBAR ELECTRIC COMPANY, New York City, has leased a one-story brick warehouse and office building now in the course of erection in Memphis, Tenn. The new structure is located at Linden and Beale Avenues. Occupancy has been promised as of Jan. 15, 1928.

WHITE COMPANY, Cleveland, Ohio, announced a short time ago the addition of another new direct factory branch with the opening of a new building in Bronx Borough, New York City. The completed building is two stories and basement, of fireproof concrete and brick construction, and cost $250,000. It has 90,000 sq.ft. of floor space and is located on Cypress Avenue between East 132d and East 133d Streets. L. C. Watson is in charge of sales and G. F. Downing in charge of service at the Bronx branch.

NEW YORK, NEW HAVEN & HARTFORD RAILROAD, New Haven, Conn., will have its substation at Devon, Conn., finished soon, recent reports indicated. The U. G. I. Construction Company, Philadelphia, Pa., has completed its work on the substation. The balance of the electrical equipment, it was reported, would be installed at once. The station was built to feed the trolley lines of the Connecticut Company and the electrified lines of the railroad.

TRADE NOTES

MORTON MANUFACTURING COMPANY, Chicago, Ill., has announced the appointment as of Nov. 1 of H. B. Wilson, 915 Olive Street, St. Louis, Mo., to be southwestern sales manager of the railroad division of the Morton Manufacturing Company. Mr. Wilson will supervise the sale of the complete "Morton line of railway appliances."

BALDWIN LOCOMOTIVE WORKS and STANDARD STEEL WORKS COMPANY announce the removal of their offices from Suite 1210 Boatmen's Bank Building to Suite 1520 Telephone Building, 1010 Pine Street, St. Louis.

CLEVELAND FROG & CROSSING COMPANY, Cleveland, Ohio, has announced the appointment Nov. 15 of Joseph A. Donahey, heretofore sales and service engineer, as manager of sales, to succeed George Stanton, deceased.

MORSE TWIST DRILL & MACHINE COMPANY, New Bedford, Mass., has announced the opening of a store at 92 Lafayette Street, New York City, where it has put in a complete stock of its products.

LINCOLN ELECTRIC COMPANY, Cleveland, Ohio, manufacturer of "Linc-Weld" motors and "Stable-Arc" welders, announces the appointment of E. A. Thornwell, Atlanta, Ga., as its representative for Georgia and eastern Tennessee. Mr. Thornwell has been associated with the electrical industry in Atlanta, Ga., and Pittsburgh, Pa., since he was graduated in 1904 from Clemson College, South Carolina. John Van Horn, factory engineer for the company, has been attached to the Atlanta office to assist Mr. Thornwell.

ADVERTISING LITERATURE

ATLAS LUMNITE CEMENT COMPANY, INC., New York, has issued an illustrated brochure emphasizing the advantages of using Lumnite cement in the winter. The manufacturers advise that they will send copies to any one interested upon request.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has issued an attractive booklet on waterwheel-driven generators, showing many hydro-electric installations using this type of generator.

TIMKEN-DETROIT AXLE COMPANY, Detroit, Mich., has recently issued a pamphlet entitled "Efficiency of F. J. Worm Gearing," which is illustrated with pictures and charts.

CROUSE-HINDS COMPANY, Syracuse, N. Y., has issued an illustrated folder descriptive of its floodlight projectors, calling attention to their industrial and other uses.

Volume 70 New York, Saturday, December 10, 1927 *Number 24*

Under New Auspices in St. Louis

ANOTHER of the electric railways has just emerged from among those thrown into receivership largely as a consequence of the imposition of war-time economic conditions over which they had no control. The property to which reference is made is the United Railways, St. Louis. From now on the road there will function under the title of the St. Louis Public Service Company.

The way has been carefully prepared in advance, and the new management takes hold under auspicious circumstances, even though the franchise question remains to be adjusted. That is an important matter, but the task does not appear to be an insuperable one. The grant that has been discussed is of the service-at-cost type. The main differences of opinion have been over the matter of valuation and the rate of return. These negotiations have been followed in the news columns. The financial results under the receivership, notably those for the year ended Dec. 31, 1926, have also been reviewed in the JOURNAL.

Frank acknowledgment is made by the new management of the excellent work done by the receiver and by his general manager. More than this, however, the incoming régime has acknowledged the magnitude of the task it is tackling and has sought public co-operation at the inception of its incumbency. It senses the growing needs of the community. The avowed policy is to determine the character of the service desired by the public and then to supply that service. Having done this, the management assumes that the public will gladly pay the fare necessary to maintain it. The new management has made a sincere bid for public co-operation. It has pledged the company in unmistakable terms to do its part. The car riders and the public of St. Louis generally owe it not so much to the company as to themselves to be equally concerned for the welfare of the company. Only as each is concerned about the other can the company carry on successfully and the public benefit.

Experiment in Regulating the Cruising Taxi in Philadelphia

CRUISING taxis have long been the bane of officials intrusted with the problem of expediting street traffic. They run empty a large part of the time and so clutter the streets that they really are more nuisance than benefit. The very growth of the taxi business in large communities has served to defeat that vehicle's attractive features, particularly the feature of speed. In Philadelphia last winter things came to a very bad pass. Congestion there was unusually acute. In some instances it spelled defeat for everybody concerned. It was imperative that something be done. And something has been done. The Yellow Cab Company, under Philadelphia Rapid Transit Company auspices, and the Quaker City Cab Company have agreed to a working arrangement calling for the expansion of the idea of fixed stands in the central business district that would seem to hold forth great promise for the future. Its proposed use, beginning on Dec. 12, is described elsewhere in this issue.

So far as these companies were concerned the matter was apparently easy to arrange. Not so in the case of the Diamond and the Cunningham companies. They are among the smaller independents, and their officers felt that they must be permitted to continue cruising, since their revenue was derived almost wholly from this source. In this attitude they may have been justified, but it is the very attitude that has served to clutter up the streets with vehicles. The way out in this instance was found in their purchase by the Philadelphia Rapid Transit Company. It was a fortunate way for everybody involved, but it is a way not always possible. But the real interest is in what the two other companies have agreed to do. It is to be hoped that the arrangement now about to be put into effect will work out so satisfactorily that the expectation of the companies looking toward the gradual extension of the plan throughout the city may be realized.

Ballots on Engineering Standards Demand Attention

RECOMMENDATIONS of committees of the American Electric Railway Engineering Association are now being submitted to the membership for approval in accordance with the changes in the constitution and by-laws adopted at the Cleveland convention last October. So far returns from three letter ballots have been closed, covering proposed revisions of existing Manual sections or presenting additional sections for approval. The plan is a distinct advance over the old one of having a discussion on the convention floor, followed by an oral vote unless a division was called for. Under the old plan it was necessary for anyone desiring to take an active position favoring or opposing a recommendation to be present in person at the convention or to have an accredited representative. The opportunity for discussion was quite limited on account of the number of recommendations presented, since they covered the work of all the engineering committees for the entire year. Usually most of the recommendations were approved without discussion, and often without some members knowing just what they had voted on.

Contrast this with the new plan. Letter ballots are sent out to the entire membership. It is possible for the company official most familiar with the subject in question to give it his attention and to vote intelligently after mature deliberation and correspondence or conference if necessary. Accordingly, when a standard has been adopted in this manner it should have more weight and member companies should adhere more closely to it than when the former method was in force.

According to an article in the December issue of *Aera,* the returns from the first set of letter ballots were sur-

Digitized by Google

prisingly small. It would appear that the membership is not fully acquainted with the plan, particularly since quite a number of companies that are represented on the committees in charge of the standardization work did not cast ballots. With many questionnaires and miscellaneous matter being received constantly, it is not surprising that persons unfamiliar with the new plan might fail to refer the ballots to the proper officials in the organization. It does not seem reasonable that a committeeman who has followed the work should not be able to cast a ballot either for or against the proposed standard.

A second set of ballots was distributed under date of Nov. 2 and a third set under date of Nov. 25. To be counted they must be returned within 60 days. It is to be hoped that more of the member companies will consider the questions submitted and take definite action, since the value of the standards set up depends in large measure on the interest taken in their adoption and in their enforcement. A standard that is a dead letter is worse than useless, since it is misleading.

Standard Bus Accounts Desirable

UNTIL the committee on bus accounting of the American Electric Railway Accountants' Association promulgated its standard classification there was no generally recognized standard available. The committee did an excellent piece of work, and its classification, which has been indorsed by the National Association of Railroad and Utilities Commissioners, is based on the accounts adopted for electric railways by the Interstate Commerce Commission. The A.E.R.A.A. classification has been adopted by a number of bus subsidiaries of electric railways and also by some independents. It is giving general satisfaction.

Naturally, in a field so new as this, there is an opportunity for differences of opinion, and certain of the accounts may be handled in more ways than one. The same is true of any accounting. In order to have comparable statistics it is essential that the same system be used by all the carriers in the territory where comparisons are to be made, whether it is the state or the nation. Since operating methods differ little all over the country there seems to be small reason for a departure from a single system. On the other hand, there is more need for a difference in detail between large operators and small, since it would be burdensome to require the analysis for a small company that is demanded of the large one. This has been taken care of by the committee in the preparation of a condensed system of accounts for small operators.

When the Public Service Commission of Pennsylvania adopted a classification for bus accounts, to go into effect on Jan. 1 next, a number of changes were incorporated that result in more or less variation from the association's system. As mentioned in a news item in this issue, the principal differences are with respect to the handling of taxes, rents and depreciation. While there is some argument in favor of the changes, there is the stronger argument in favor of standardization.

At present two other commissions, those in Iowa and in Wisconsin, are contemplating the adoption of standard classifications for bus accounting. It would seem that now is the time to get together and reconcile all differences. Unless there are reasons for changing from the association's classification, that would seem to be the logical one to adopt. If reasons for a change exist, undoubtedly the committee will welcome suggestions and present them to the membership for adoption. Whatever is done, action should be taken before the various states adopt sets of accounting classifications with differences so great that two or more sets of books will be needed, as may be necessary for interstate operators.

European Roads Tending Toward Fare Simplification

WHILE it is common in this country to think of the street railways of Europe as charging zone fares exclusively, this is very far from true. The lines in England, France and Belgium generally use the zone fare system, but many of those in Italy, Germany and Switzerland do not. In fact, the tendency is rather from the zone fare to the flat fare. The introduction of more one-man cars will help in this direction, though as the wages of platform men are not as high in Europe as here, there is not the same inducement to the adoption of the one-man car.

The lower wages paid in Europe should be borne in mind when comparisons between European and American fares are made, as should also the fact that fewer free transfers are issued than in America. This rarity of the free transfer is an inheritance, probably, from the time when zone fares were in more general use. Where fares vary with the distance traveled, there is no occasion for transfers. When a zone fare road changes to the flat fare the public is not accustomed to transfers and does not expect them. In Europe, Berlin is the most important exception to the rule that universal transfers are not given.

Passenger revenues in Europe are still checked very generally through the issue by the conductor to the passenger of a paper receipt for the fare paid. On the flat fare roads, this practice seems to be still another inheritance from the zone fare system in which such receipts or something corresponding to them are necessary to prevent overriding. To an American, the fare box seems to provide a better means for collecting fares. It is at once less liable to manipulation, is cheaper and faster. Finally, it is neater because it keeps the car floor and street free from canceled tickets. However, here again the strength of long-established habits have to be taken into account. The public and the employees have become accustomed to the fare receipt. They do not mind its disadvantages and the companies declare that its abuse by either employees or passengers is practically nil. At present, progress in Europe in fare collection seems to be more in the direction of ticket-issuing machines than in the abandonment of the paper fare receipt.

The principal improvement in fare practice during the last few years in Europe has been in the direction of having only one class of fare. The Berlin Elevated is the latest large road to change from two classes to one. Among the surface roads those in France and Belgium appear to cling most strongly to the two classes of fares, using them, in some cities, even on cross-bench open cars.

There is no doubt that the system of fare collection used in this country is better adapted to American conditions than is the European plan. We should gain nothing on our flat fare lines by adopting the paper fare receipt, which is primarily a zone fare device. But there is much that can be said in favor of the European method of

Digitized by Google

operating through cars between all points where there is considerable travel and then refusing to give transfers. One reason for the low flat fares in many cities abroad is that a fare pays for only one ride, not two or three, as would be the case with transfers. By permitting a lower flat fare, this policy also increases the short-haul business, which is the one where a street railway has to meet competition from walking.

Head of Pennsylvania Motor Federation Condemns Parking

FREQUENTLY when experienced transportation men have pointed out the evils of automobile parking on congested streets they have been accused of attempting to force greater use of public transportation vehicles. But when the spokesman of more than a million owners of private automobiles says the same thing no such accusation can reasonably be made. Unusual significance therefore attaches to the remarks of R. C. Haldeman, president of the Pennsylvania Motor Federation, speaking before the meeting of the Pennsylvania Street Railway Association at Scranton last week.

"The present-day habit of using our streets as a public garage," he says, "is one of the greatest evils tending to increase congestion in the business districts of our municipalities. It is both a selfish and a time-wasting habit of the motor car owner. The individual apparently gives no thought to the inconvenience that his action places on the many. But if the individual still insists on being selfish let him consider the time he is wasting. It averages at least ten minutes to get the car out of a garage in the morning. He drives down town with his mind set on a particularly convenient locality in which to leave his car. At least 99 times out of 100 he finds that place occupied by an earlier riser and he spends ten minutes more looking for some other niche. It is probably three or four blocks from his office or wherever he desires to transact his business. Another ten minutes lost. Life is too short to throw away all this time to satisfy a purely selfish whim."

This states in a nutshell the case against automobile parking. It hurts the automobilist more than it helps him. The number of drivers who benefit is insignificant compared to the number who are inconvenienced, to say nothing of the great majority of the users of the street—the passengers in public transportation vehicles.

Unselfish co-operation between the automobilists and the public transportation systems is the remedy Mr. Haldeman recommends. He has done the public a real service by presenting such a definite, clear-cut statement of the situation. That is good, but the prime requisite today is more general understanding of the evils of parking.

"Narrow-Gage" Purchase an Important Move

SPECIAL interest attaches to the announcement of the purchase by Hemphill & Wells of the Boston, Revere Beach & Lynn Railroad and of the new owners' plans to electrify the system. This comparatively short narrow-gage line handles a relatively dense volume of passenger traffic, serving a limited area. For years its future has been under discussion. In the Massachusetts report on improved transportation facilities in the Boston metropolitan district two major recommendations were made affecting the Boston, Revere Beach & Lynn Railroad. The first was for the Boston Elevated Railway to extend its East Boston tunnel line to a junction in the vicinity of Wood Island station, thereby eliminating the necessity for providing ferry service. The second called for complete electrification of the system.

It is significant that one of the most important recommendations in the report is to be carried out forthwith. It is known that as far back as 1911 plans were prepared for such a project. Whatever the plans of the former owners might have been it is reasonably certain that the work would not have been ordered so soon.

The new service will mean much to the district. The modern cars, comfortable and attractive; the stations, remodeled for prepayment use and refinished, and the high-speed transportation to be maintained by the new electric trains should cause a large increase in patronage. Property owners will realize, too, that values will grow because of the new service. All in all, the purchase by Hemphill & Wells and their plan to electrify are very important moves not only in the districts served by the old Boston, Revere Beach & Lynn Railroad but in the entire electric railway industry as well.

Glorifying the Coffin Award

ADVERTISING, it has been said, is just a combination of showmanship and salesmanship. Surely no better definition could be found for the sound and progressive advertising exploitation launched by Louis J. DeLamarter, vice-president and general manager Grand Rapids Railroad, after his road had submitted its Coffin Award brief and continued so effectively after winning the award.

To electric railway men the Coffin Award means a great deal. They realize that it is the highest honor that can come to any American system and that it represents the reward of progressiveness and superlative achievement in the industry. But to the ordinary layman it might represent almost anything. The task, then, of livening this issue in the minds of the citizenry of Grand Rapids befell Mr. DeLamarter, if winning the award was to mean anything in a dollars and cents way. His previous experience as a showman had taught him the value of capitalizing on public reactions. Accordingly he prepared, so to speak, all Grand Rapids for the possible winning by acquainting it with the Coffin Award and its significance.

The effect was far reaching. The people not only learned what the award was but also what it would mean to the city and to themselves. They realized that their own town was competing with cities such as Chicago and Atlanta and they felt a little prouder of their "Furniture City." A pride in the shiny new street cars that were being advertised the world over as "Grand Rapids" type cars swept over them, and a desire to help win was created among the various civic groups and individuals as well. The Coffin Award was publicized to so great an extent that it bids fair to remain alive for many years in the memories of all Grand Rapids people.

Truly the Coffin Award has been glorified under the impetus of a carefully conducted advertising plan until now it represents to the people of Grand Rapids an "emblem of civic virtue, a badge of merit and a symbol of communal achievement." And all because one alert electric railway salesman realized the capitalization possibilities of such a proposition under the stimulus of a sound and progressive plan of advertising exploitation.

An Appreciation

The Grand Rapids Railroad Company has been Awarded

The Charles A. Coffin Gold Medal

By the American Electric Railway Association

This honor is recognition of the Furniture City's superiority in development of street railway transportation for the benefit, comfort and convenience of the public—a tribute in which every resident shares.

Your street railway company appreciates this victory because it is based upon the justice, friendship and co-operation of our patrons, the city government, the newspapers and various civic organizations.

This award will further advertise Grand Rapids throughout the world.

It also increases the public service obligation of every street railway worker in Grand Rapids. We have a reputation to sustain and gladly dedicate our untiring efforts to the end that the confidence of our home city shall be justified

Capitalizing the Coffin Award

All Grand Rapids knew in advance of the Coffin Award and its significance, because of a careful plan of advertising. When the medal was won enthusiasm became universal and citizens joined the railroad in acclaiming the victory

DETERMINED to capitalize to the fullest extent his company's entering the Coffin Award contest, L. J. DeLamarter, vice-president Grand Rapids Railroad, Grand Rapids, Mich., planned a series of car cards and gave details of the contest to all the local newspapers for publication. He explained to the people of Grand Rapids just what the Coffin Award was and what it meant, showed them the wares of his railroad and sold the thought that in their city existed the most progressive street railway system in the country. Few, if any, disputed the company's chance of winning, even though it was competing with much larger roads.

Upon winning the award, the railroad immediately spread the news. Car cards, newspaper write-ups and full-page advertisements in the local papers told the people of Grand Rapids that the great honor about which they had already been informed had been bestowed upon the railroad of their city. Many business houses of the city congratulated the railroad in advertisements carried in the local papers and profited with the company in the winning of the award. Resolutions, congratulatory letters and messages poured in and editorial columns praised the city's electric railway which had proved itself supreme.

Six progressive car cards told the story in an effective manner. They related that Grand Rapids was competing with cities such as Chicago and St. Louis, that winning the Charles A. Coffin Award corresponded to winning the World's Championship in baseball, that the medal if brought to Grand Rapids would advertise the city throughout the world, and that the railroad's biggest asset was the splendid, progressive spirit of Grand Rapids people. The copy of the first card reads:

To our patrons:

Your Street Railway is competing with Chicago, St. Louis and other large cities for the

Charles A. Coffin Gold Medal

given each year to the street railway whose achievements represent the most distinguished contribution for the benefit and convenience of the public.

If Grand Rapids wins, it will be largely because of your sympathetic co-operation, your moral support, your patronage.

This was followed by a card pointing out the importance of the award to the industry and the road winning it.

The Charles A. Coffin Gold Medal Will Be Awarded to Some City Early in October.

In the street railway industry, it is like the World Championship in baseball.

We are after this "world championship" for Grand Rapids. If we win, it will be more of a victory for Grand Rapids and Grand Rapids people than for the Grand Rapids Railroad Company.

All publicity conveyed the feeling that the city and its people and not the efforts of the railroad were responsible for the progressiveness of the street railway system. The people were made to believe that they were competing

Digitized by Google

and that in the event of winning, the victory would be theirs. Another of the cards best exemplifies the theme of the advertising plan as a whole:

We cannot hope to compete with such cities as Chicago and St. Louis on the basis of miles of track, number of cars or volume of business. But we have an asset in the splendid, progressive spirit of Grand Rapids people with which we do not hesitate to challenge the world.

If We Can Win the Charles A. Coffin Gold Medal for Grand Rapids, It Will Be a Triumph for Your City and for You.

Newspaper publicity supplemented the car cards in relating the purpose and history of the contest, the names of the competing railways and how the prize of $1,000 would be given to employees' benefit organizations, if won. The papers also pointed out that the brief submitted by the railroad company had stressed the importance of the enthusiastic, loyal and sympathetic cooperation of the Grand Rapids municipal authorities, newspapers, civic organizations and general public as the predominating argument for the favorable consideration of the judges.

The following statements by Mr. DeLamarter, published in the local papers on Sept. 30, conveyed a feeling of confidence that the company did have a chance against its powerful competitors:

It may seem presumptuous to some of the bigger companies in the street railway industry, and to some of the Grand Rapids people for the Grand Rapids Railroad Company to enter this competition with the leading companies of the United States, but we are just egotistical enough to believe that our showing here with our new electric rail coaches and other innovations is rather conclusive evidence that "Grand Rapids Knows How."

If we should win this award, against the stiff competition of Chicago, St. Louis and the other large cities of the country, it must be largely on the strength of the friendly, constructive assistance and co-operation we have had in Grand Rapids. In sheer bulk and volume of business, mileage of track, number of cars, etc., we could not hope to compete successfully against the great centers of industry and population.

Public relations, economy, progressive methods, safety and efficiency of operation are not elements measurable by mere size, so on these points the Grand Rapids Railroad Company is justified in entering into competition with any of them.

The business-like preparation of the advance publicity served well the purpose for which it was intended. All Grand Rapids had contributed and upon the eve of announcing the winner all Grand Rapids eagerly awaited

GRAND RAPIDS, MICH., Oct. 26, 1927.

MR. L. J. DELAMARTER,
Vice-President and General Manager

DEAR SIR:

The Grand Rapids Railroad Company's Employees' Mutual Protective and Benefit Association wishes to again congratulate you on your success in winning the Charles A. Coffin Award for our company. We also appreciate being recognized as helping to do our bit toward winning this award and we, as an association, pledge ourselves to keep our shoulders to the wheel to help maintain the high standard which has been achieved, and we stand ready to help in any further cause you may desire toward the betterment of our company.

At our meeting held Tuesday, Oct. 25, it was voted to extend you a rising vote of thanks for the $500 prize money and the splendid entertainment furnished us on the 19th, which was greatly enjoyed by all present. It is very pleasing to our members to hear the words of praise spoken by our passengers of the way this prize money was distributed by you, and we wish to assure you that we all feel proud to be associated with a company that has gained such high honors.

Very truly yours,
MAX HANNA,
Secretary Grand Rapids Railroad Company's Employees' Mutual Protective and Benefit Association.

"Proud to be associated with the company" is the keynote of this letter from the employees' protective association

the decision that might bring to their city the title of "Gold Medal City."

When the news broke everyone rejoiced. The stage had been set and the citizenry joined the railroad in acclaiming the victory. The company officially announced the receipt of the award by full-page newspaper advertisements, by advertisements carried in weekly publications and by car cards.

GRAND RAPIDS, MICH., Oct. 13, 1927.

MR. L. J. DELAMARTER,
Vice-President and General Manager
Grand Rapids Railroad Company,
Grand Rapids, Mich.

DEAR MR. DELAMARTER:

We, the officers and members of Division 836, congratulate you and the Grand Rapids Railroad Company for the opportunity given us to do our bit in winning the Coffin Award.

We realize it was only through the efforts of you, Mr. DeLamarter, that this was made possible, and we again congratulate and thank you.

Very truly yours,
CLAUDE W. FISHER,
President Division 836 Amalgamated Association of Street and Electric Railway Employees of America.

Letter of appreciation from the Amalgamated Association revealing the fine spirit existing between the employees and the management

Newspapers, merchants and railroad all joined in capitalizing the victory, for on the day following the announcement advertisements congratulating the railroad on its accomplishment were given to the papers by many local companies and merchants, as well as two railway equipment manufacturers, the Haskelite Manufacturing Corporation and the St. Louis Car Company. One paper devoted an entire section to acclaiming the victory. Others responded with "Gold Medal" editions.

The complete success of the railroad's educational plan was best evidenced by the many editorials appearing in the newspapers and the felicitations tendered Mr. DeLamarter and his associates by civic bodies, publications, social organizations and other groups. There followed resolutions, telegrams and complimentary speeches. The enthusiasm, which became universal, was climaxed by a dinner gathering at which Mr. DeLamarter and his associates were paid high tribute.

Typical of the telegrams congratulating Mr. DeLamarter and his company is the one sent by the Governor of Michigan:

Permit me to congratulate you upon award of Charles A. Coffin gold medal. It is splendid recognition of work well done.
FRED W. GREEN
(Governor State of Michigan)

Another, from a State Senator, shows the feeling of indebtedness inspired by the railroad:

Accept my congratulations upon having received the Charles A. Coffin gold medal. The city of Grand Rapids has been honored through your untiring efforts and is indebted to you for same. I anxiously await your return to congratulate you in person.
JAMES C. QUINLAN
(Senator State of Michigan)

Bespeaking the sentiments of the entire city, the Mayor of Grand Rapids wired:

Congratulations on receiving the Coffin Award. Your work here certainly justifies that distinction. The entire city unites in these felicitations.
ELVIN SWARTHOUT
(Mayor City of Grand Rapids)

A desire to exhaust all the capitalizing possibilities of receiving the honor prompted Mr. DeLamarter to take further steps. At a big party for all the company's employees two checks of $500 each, representing the cash prize which accompanied the Coffin medal, were presented, one to the president of the local division of the Amalgamated Association of Street and Electric Railway Employees of America and the other to the president of the Grand Rapids Railroad Company's Employees' Mutual Protective and Benefit Association. A musical program and a speech by Dr. A. W. Wishart of Grand Rapids, who lauded the co-operation of the employees and management, made the evening a most enjoyable one and added to the effectiveness of distributing the cash prize.

A final ambassador of good will was sent forth to the people of Grand Rapids in a sincere expression of appreciation of the "justice, friendship and co-operation of our patrons, the city government, the newspapers and various civic organizations." Tying together reproductions of the Coffin Medal, the City Seal and the company's triangular shaped monogram to be painted on the cars, the advertisement struck the keynote of the whole campaign.

In addition to placing this new design on the cars, gummed paper replicas of the front and reverse of the medal have been made in gold for use as stickers on company correspondence, carrying far and wide the information that Grand Rapids won the Coffin Award.

Wide-angle full-vision side windows with 42-in. post centers add to the attractiveness

De Luxe Trend

Shown in the New Brill Car

The 1928 model, as it is called, has graceful lines, sloping front end, motors spring mounted crosswise of trucks using Nuttall speed reducing units with helical gears

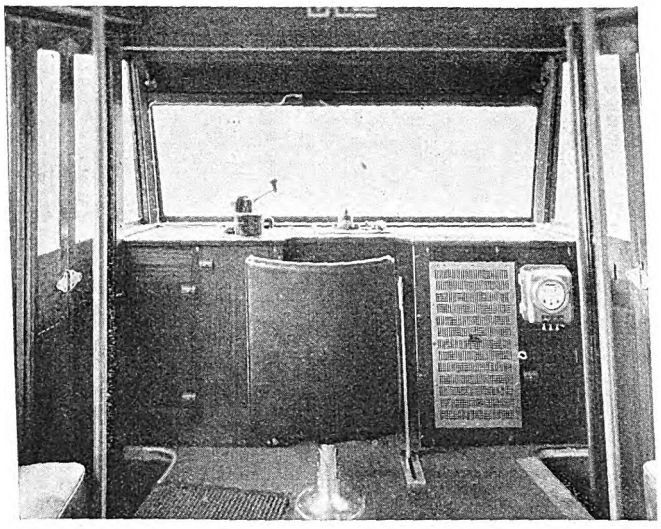
LIGHT weight, low floor height, improved appearance, greater comfort, increased efficiency and less noise are features of the new Brill 1928 model electric car which was shown to the electric railway industry for the first time at the Cleveland convention and has just been placed in service on one of the surface lines in Brooklyn. Tests of the cars were made in Cleveland immediately following the convention.

This development in car construction embodies many features that are entirely new to the electric railway industry, yet at the same time it retains most of the fundamentals in design and construction that have been responsible for the economic advantages of the electric car. In the design of this car the Brill company has recognized the importance of substantial construction for safety and durability. Low maintenance costs have been considered, together with a design that will be reasonably light in weight and of low energy consumption, rapid acceleration and retardation in order to speed up operating schedules.

While all of the radical features of design introduced in this car are of particular interest, the innovations in the trucks, especially the manner in which the high-speed motors are mounted and the method that is used to transmit power to the axles, are of outstanding importance. Two Westinghouse 35-hp. 300/600-volt d.c. motors are supported on angle brackets between the end frames and transoms so that their entire weight is spring mounted, leaving only the wheels, axles, roller bearing journals, brake drums and half of the gear units as unsprung weight. The motors are connected by universal fabric joints to the specially developed reduction gear unit of Nuttall deep helical type. The gear ratio is 8.38 to 1.

This achievement is the result of three years of experimental and practical engineering development together with test work. The Westinghouse-Nuttall drive is a unit of gears operating entirely in oil so designed that 22-in. wheel trucks may be used with greater clearance under the motors than was formerly possible with 26-in. wheels. This drive is quiet running, permits the use of motors higher in speed and lighter in weight than is usual, and makes it practicable to use roller bearings for the armature. Axle bearings are eliminated from the motor, as it is entirely spring borne through a truck frame suspension. The result is rapid, smooth acceleration, high efficiency and low maintenance cost. With the gears inclosed and constantly lubricated, it is logical that gear noises will be reduced to a minimum. In other general features the trucks, which are type 277-Ex-1,

Digitized by Google



The equipment cabinets at the ends fit into the sloping fronts and give a finished appearance

conform to conventional practice. The side frames are solid forgings, light in weight. The graduated spring system contributes to the smooth and comfortable riding.

As a further means of reducing noise, instead of using shoe wheel brakes a brake drum is located on each axle, against which a set of clasp-type brakeshoes of special design are pressed by means of a separate Westinghouse brake cylinder for each drum. The brake mechanism is of the external contracting clamp drum type with two shoes or blocks per drum, the shoes being of a special composition, suspended in such a manner that they are practically noiseless. By mounting the cylinders on the truck instead of on the car body, considerable body brake rigging is eliminated which would have a tendency to cause rattling and disagreeable noise. The air brakes are

Westinghouse electro-pneumatic type. Timken roller journal bearings are used.

The car body is constructed of pressed steel and structural shapes with aluminum letter panels and side sheathing. The body design conforms generally to the graceful lines of the motor bus. While a tendency is shown to reduce weight, particular attention has been given to providing necessary strength so as to stand up under the severe requirements of electric railway operation. Side sills are 3-in. x 3-in. x $\frac{5}{16}$-in. angles and end sills are of a box type built up of two 3-in. channels as sides with top and bottom plates. Crossings are of pressed-steel fish-belly type. Outside platform knees are 7-in. channels and center platform knees are 3-in. channels. Bolsters are of the box girder type with $\frac{1}{2}$-in. bottom plate, $\frac{3}{8}$-in. top plate and $\frac{3}{16}$-in. web. The latter are fastened to each other by means of diaphragm connections.

The body frame has pressed U posts of No. 16 gage steel and a double-belt rail of aluminum, $2\frac{1}{2}$ in. x $\frac{3}{8}$ in. The letter panel is $\frac{1}{8}$-in. semi-hard aluminum, $15\frac{1}{2}$ in. deep. Aluminum gutters form the top molding and half oval aluminum is used for the bottom. The letter panel has U-pressings at the top. Panels are curved at

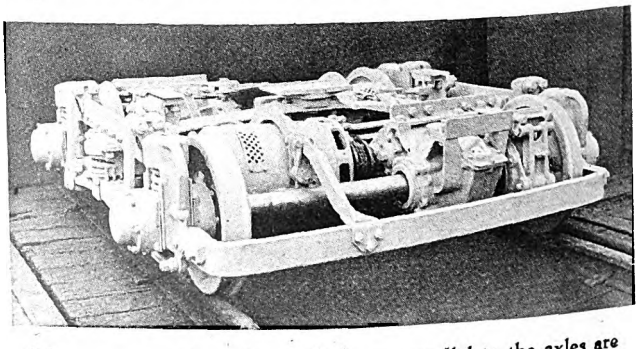
23	150	565	30	4.2	2.3	12.2	2.9

the floor line and side sheets are of hard aluminum, $\frac{1}{8}$ in. thick. The window sill capping is No. 16 gage steel, and pressed gussets are used at each crossing. The posts have ash fillers and all sheet steel is copper bearing. End headers are eliminated and corner posts and end carlines are of special design. Joints between the window sill and post are welded.

Vestibules have a width of 7 ft. at the car body and are tapered toward the front. The front sash is sloping, similar to that in the Springfield car. This has a visor and ventilator in back of it. The construction below the windows is also of the Springfield car type.

The roof is $\frac{5}{16}$-in. plywood. Roof rafters are of pressed U shapes filled with wood and not cut. The roof is fastened to the rafters with glue and screws and crowned $10\frac{1}{2}$-in. Hoods are of plywood. Unusually low floor height has been obtained with the use of 22-in. diameter wheels. This small-diameter wheel was made possible only through the use of smaller motor dimensions and a reduction in the amount of equipment under the car body. The car floor is only $28\frac{3}{4}$ in. above the rail. Consequently but two steps are required. These are stationary inside the folding doors. The first is 15



Motors mounted on the truck frame parallel to the axles are connected to gear boxes through universal joints

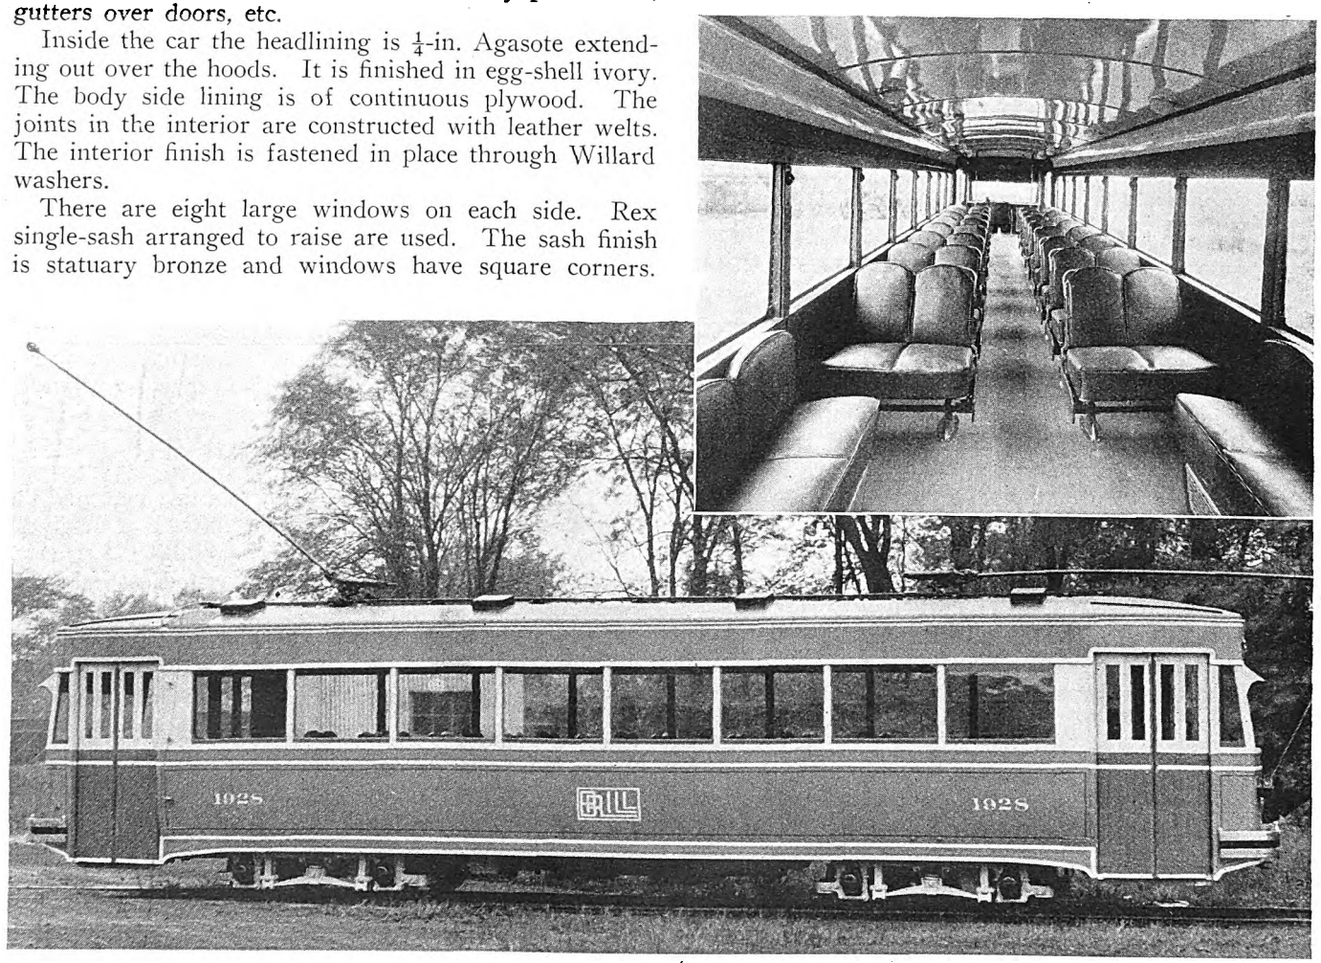
Digitized by Google

in. above the rail and the second 13¾ in. to the car floor. There is no floor ramp. The flooring is 1 1/16-in. fir, top dressed and treated with Saums preservative. The floor is laid longitudinally and is bolted to cross members. There are no trap doors. The floor covering is 3/16-in. battleship linoleum, green in color.

On the roof two running boards, 7/8 in. thick by 5½ in. wide, extend the full length of the body. The trolley base is insulated from the trolley boards with rubberized felt. Eight steps are available for roof mounting and other equipment includes roof mats, trolley pole hooks, gutters over doors, etc.

Inside the car the headlining is ¼-in. Agasote extending out over the hoods. It is finished in egg-shell ivory. The body side lining is of continuous plywood. The joints in the interior are constructed with leather welts. The interior finish is fastened in place through Willard washers.

There are eight large windows on each side. Rex single-sash arranged to raise are used. The sash finish is statuary bronze and windows have square corners.



Built low to the ground the Brill 1928 car invites prospective passengers. Walnut finish for the interior with brown leather seats with sloping cushions and backs to give a pleasing effect

Each sash has two locks and racks. Plate glass 3/16 in. thick is used in the stationary front sash for the vestibules. The small side sash of the vestibules, and all other glass in the body, side windows and doors are of ⅛-in. selected Libbey Owens glass.

Doors are 1 1/16-in. mahogany with no glass below the belt rail. The doors are of a two-part folding type arranged to swing outward and have a 34-in. opening in the clear. They are located at each corner of the platform. Automatic treadle devices are placed at the rear right-hand side doors. For operation small-type engines are used. The car being arranged for one-man, double-end operation, entrance at the front and exit at the rear insure circulating load.

Bumpers are solid with a projection of 6 in. They are secured to the vestibule underframe by spring-steel brackets. Bumperettes are provided at corners.

Inside the car body Brill type 201-B-1 passenger seats embody a slope to the cushion and pitch to the back designed to provide maximum passenger comfort. All seats are in keeping with the modern trend in this direction. A Brill No. 1006 operator's seat at each end is not only adjustable for leg length by a sliding device but is also adjustable for height, and is reversible so that it can be used as a passenger seat when the car is going in the opposite direction. When in position it is locked by a clamp. Operating equipment is concealed in vestibule cabinets so that there is nothing to mar the beauty of the mahogany interior trim, which is stained walnut. This, together with the sloping windshield at each end, gives an inviting appearance.

The exterior paint scheme is a plain, pleasing combination to carry out the streamline effect. Old rose or clover club color is used for the main body panels and letter panels, with the relief trimmed in cream. Striping and decorations are of gold leaf. The roof is dark green and the trucks are the same color to harmonize with it. The finish used on the car is Duco.

A notice "Watch Your Step" is stenciled on each step riser, and the words "In" and "Out" appear over the doors—"In" for the front doors, and "Out" for the rear doors. Inside the car the words "Leave at Rear Door" appear on the ventilator cover over the operator's position.

Located over the vestibule windows in the letter panel is a sign of the Hunter type carrying route number and destination readings.

To obtain data on the performance of the 1928 model

Digitized by Google

car, tests were conducted over the tracks of the Cleveland Railway and also at the plant of the G. C. Kuhlman Car Company. Information was obtained showing the maximum temperature rise of the motors in city service, energy consumption, maximum rate of acceleration and retardation, coasting resistance, and freedom from noise. The service tests were made on the Euclid Avenue line. To approximate the average all-day load, brake shoes were placed on the car. This, together with the test observers, gave a total load of 5,000 lb. With the 30,000 lb. weight of the car, this made 35,000 lb. for the average weight of the car in all day service. For convenience in segregating the various data the line was divided into sections, one being in a congested district and another in a non-congested condition.

TABLE III—BRAKING TEST ON BRILL 1928 CAR, CLEVELAND, OHIO, OCT. 20, 1927

**9	110	6.0	25.0	5.0

* Emergency braking from dead-man's handle.
** Emergency braking from air brake handle.

In the test to determine energy consumption the meter was connected to read only the energy supplied to the traction motors and did not include that used by lights, heaters or compressors. Accompanying tables show the data obtained. The tests show an average of 2.4 kw.-hr. per car-mile for 63.6 miles operation between Windermere and the public square. Energy used in turning the car at Windermere and other operation not representative of revenue mileage was neglected. Operation was during the most congested hours when stops were most frequent. Due to operation between cars on regular runs, the car was not operated in the same manner as would be a car in revenue service, since acceleration and braking in many cases were faster. In the service on Euclid Avenue there were no hills, hence no power is included for the effect of grades as encountered in most cities. The results, however, show what can be expected for the service and grades on this particular line.

To determine acceleration rates, the car was tested on a section of tangent and practically level track. Starting was from the same point in all tests, the controller handle being moved by the operator at practically a uniform rate. Meters gave the trolley voltage and current per motor. The time to reach full parallel position of the controller was recorded and the distance from the start to the end of the acceleration on resistance was also obtained. Readings were made instantaneously and simultaneously.

No attempt was made to obtain the maximum acceleration during every test and the results in the table are for various rates to ascertain the effect on both the car and passengers during normal and high car acceleration. In one test more than 5 m.p.h.p.s. acceleration rate was obtained. The wheels were just at the slipping point and it would therefore appear that this rate is the maximum possible. This is probably three times as high as is normally employed on most railways. In regular operation acceleration rates of 2 to 2¼ m.p.h.p.s. can be maintained without difficulty.

In making the test for high and maximum braking rates, the car speed was obtained by measuring the distance covered from the time the brakes were applied to standstill, and recording the time for this distance. From these observations car speed and retardation rates were calculated. Tests were made to obtain average service braking as well as emergency results, this latter being from both the dead man's feature and the emergency position of the air-brake handle. The emergency results from the dead man's handle showed 3.9 m.p.h.p.s. braking rate. Emergency stops made with the air-brake valve gave rates from 3.8 to 5 m.p.h.p.s. An accompanying table gives other tests. These braking rates are very high for street cars, but were not sufficient to cause discomfort to a passenger except at the final jerk when the car came to a stop. In service, when the operator applied the brake to slow down at a high rate and then eased off before stopping, the sensation of high braking rate was not objectionable. These tests indicated that braking rates of from 3 to 4 m.p.h.p.s. could be obtained in revenue operation if the car were late and an attempt made to make up time.

To obtain values of coasting resistance, a section of tangent and approximately level track between Highland and Cove Avenues on Clifton Boulevard was measured accurately to obtain the distance between poles over a stretch of twelve pole spacings. The car was accelerated to a speed of 20 to 25 m.p.h. and power then shut off a short distance from the first pole. At the first pole a stop watch was read and the time obtained for each pole spacing as the car coasted past. From this time and the distance the average speed in the section was obtained. The rate of decrease of this average speed is the retardation rate of the car. Tests were repeated several times from various speeds, and in both directions to compensate for any slight wind velocity and for any grade. The results show the resistance varying from 32.1 lb. per ton at 25 m.p.h. to 13.7 lb. per ton at 10 m.p.h. These values of retardation resistance are for coasting only and do not represent values of train resistance during the time the motors are drawing power from the line. During acceleration the train resistance is less than the values given above for coasting resistance.

Tests of heating showed that the motor capacity was ample for the service. The maximum temperature rise obtained was 31.5 deg. C. Observations of noise made by the car, both inside and outside, showed considerably less than on most cars. This was due to the small value of unsprung weight, which reduces noise at rail joints and on special work, and to decreased noise in gearing.

GENERAL DIMENSIONS OF BRILL 1928 MODEL CAR

Length over corner posts	30 ft. 0 in.
Length over vestibules	39 ft. 8 in.
Length over bumpers	40 ft. 8 in.
Length of platform over vestibule	4 ft. 10 in.
Length of transverse seats	35 in.
Width of car at belt rail	8 ft. 4 in.
Extreme width	8 ft. 4¼ in.
Height, rail to top of floor	28¼ in.
Height, top of floor to top of roof	7 ft. 2 in.
Height, floor to underside of ceiling at centers	6 ft. 10 in.
Height, floor to belt rail	30¼ in.
Height of window opening	29¼ in.
Height, rail to top of step	15 in.
Height, top of step to platform floor	13¾ in.
Truck centers	20 ft. 0 in.
Truck wheelbase	4 ft. 10 in.
Seat centers	2 ft. 7 in.
Post spacing	42 in.
Size of wheels	22 in
Seating capacity	45
Weight of car body	12,636 lb.
Weight of seats	1,814 lb.
Weight of electric control apparatus	1,300 lb.
Weight of air brakes	1,200 lb.
Weight of trucks less motors and gears	9,026 lb.
Weight of motors and gears	4,024 lb.
Total weight of car complete ready to run	30,000 lb.

San Francisco Purchase Urged

Delos F. Wilcox recommends to city that it take over railway properties as the franchises expire. Offer of $1,000,000 for California Street Railway and $20,000,000 for Market Street Railway suggested

SAN FRANCISCO received a preliminary report on its street railway problem submitted by its expert, Dr. Delos F. Wilcox, under date of Nov. 1, 1927, and it is now available in printed form. It is devoted primarily to recommendations as to action by the city following the early expirations of a number of the franchises of the two street railway companies now operating in San Francisco. There are also comments on the policy of unification of these systems with the present San Francisco Municipal Railway, all to be under municipal ownership and operation.

One of these roads, the California Street Cable Railway, operates a narrow gage cable railway with 11 miles of single track, and its franchises expire in 1929. Dr. Wilcox considers that operation by cable, at least over large portions of the route of this company, should be continued. The company has no funded debt. On its $1,000,000 of capital stock it has been paying dividends of 7.2 per cent, though, of late, these dividends have not been earned in current operation. They have been paid out of accumulated surplus.

In 1926 the total operating revenue was $532,537, or 38.24 cents per car-mile, but the operating income after taxes and depreciation was only $9,858. During the first half of 1927 there was an operating deficit. This poor recent showing is due in large part to extraordinary expenses for personal injuries, which during this six-month period amounted to more than 31 per cent of the operating receipts. For the last five years—1922 to 1926 inclusive—this charge was only 5.28 per cent, a more reasonable figure, though still nearly double that on the municipal railway and Market Street Railway.

Basis of Valuations Adopted

No valuation of the company's property has been made by the Railway Commission or city engineer, but, based on the city engineer's figures for somewhat similarly situated cable lines belonging to the Market Street Railway, the reproduction cost new of the California Street line is estimated at $1,938,432. If 30 per cent is deducted for depreciation and $125,000 for paving which would belong to the city upon expiration of the franchises, the amount left would be $1,231,902.

If the California Street line was taken over Dr. Wilcox points out that the city would lose the taxes now paid by the company, which last year amounted to $49,858, but that amount would be saved from the operating expenses. On the other hand, the trainmen's wages would have to be increased from the company's standard of $1.12 per car per hour to the municipal railway's standard of $1.63 per car per hour. On the basis of car-hours run in 1926 the increase in trainmen's wages would be $98,910. On the basis of the company's five-year average the operating income available for return would then be approximately $26,000 per annum, or the equivalent of 5 per cent on $520,000. This figure, Dr. Wilcox says, may be considered as the amount of money which the city could afford to pay for this property with the hope of being able to pay operating expenses and interest on the investment under a 5-cent fare.

The property of the Market Street Railway, the principal privately owned line, was valued by the California Railroad Commission engineers as of Dec. 1, 1916, and in the reorganization case these engineers brought the figures by book additions and deductions up to June 30, 1920. The figures on four bases as found by them at that time follow:

Historical reproduction cost	$29,929,069
Historical reproduction cost, less depreciation	24,677,808
Reproduction cost new, based on average prices of the three-year period ended June 30, 1920	50,571,625
Reproduction cost new, less depreciation	40,700,987

Commenting on these bases, Dr. Wilcox says:

Historical reproduction cost as found included the present market value of land as of the date of the appraisal, plus an amount for other property based on the actual work done and the actual quantities in place at the date of the appraisal and an estimate of what the actual cost properly chargeable to capital account had been. This estimate included contingencies in varying percentages applied to individual accounts, and general overheads for engineering, law expenditures, interest during construction, injuries and damages, taxes and miscellaneous expenses aggregating about 13½ per cent of the base cost of the structural property.

Historical reproduction cost less depreciation was intended to represent the historical cost new as above defined, less accrued depreciation "considered solely from the physical condition standpoint" and "estimated on the straight-line theory, the data forming the necessary elements of age and life being fixed respectively from the records, inspection and the experience of this company." In its effect, the finding of accrued depreciation as of the appraisal date, June 30, 1920, was that the property was in 80 per cent condition, or, in other words, worth four-fifths what it would have been worth if new. On the basis of estimated cost, the average condition of the investment as found was slightly higher, namely, 82 per cent.

The term reproduction cost new as used in this appraisal was defined as "the estimated cost in cash of reproducing the physical property of the public utility in the State of California, as of the date of valuation, to which is added the value of all lands, based on the market value of adjacent and similar lands, the actual or estimated cost of acquiring franchises, water rights, etc., and the estimated cost of overhead expenditures for engineering, law, interest and similar items." As above shown, the price basis used was the average of construction costs for the three-year period ended June 30, 1920. That date was approximately at the peak of the street railway construction costs following the war.

Dr. Wilcox says that the 1920 figure for reproduction cost new, quoted above, obviously does not show its value now or in 1929, when the franchises expire. With the historical reproduction cost the condition is very different as it can be easily brought up to date. He estimates the historical reproduction cost as of Dec. 31, 1926, for the company and its suburban subsidiaries at $30,803,280. He then deducts 30 per cent for depreciation, which brings this figure to $21,562,296, from which he says a paving item of $2,955,019 could properly be deducted, as it would belong to the city on the expiration of the franchises.

Digitized by Google

The report gives a list of the outstanding securities of the Market Street Railway on Dec. 31, 1926, with the par value, which was $43,821,450; their market price, five-year average, which was $21,966,581, and their market price, 1926 average, which was $19,622,834.

The report also mentions another method of valuing the property, i.e., on its earning basis. The average yearly income during the past five years was $1,537,224. This sum, capitalized at 7 per cent, would call for a value of $21,960,343.

The city engineer in 1921 also made a valuation of the property, using as a basis the detailed inventory which the commission's engineer has prepared, but brought up to date. The unit prices applied to this inventory were averages for the five-year period from 1913 to 1917. This, in the main, Dr. Wilcox says, meant pre-war prices, modified to some extent by the upward trend of the last two years of that period. On this basis the city engineer obtained a reproduction cost new value of $35,273,442. On the basis of a 75 per cent condition, i.e., a deduction of 25 per cent for depreciation, the value became $26,366,366. This historical reproduction cost figure as brought up to date by Dr. Wilcox by additions to capital, but with 30 per cent allowed for depreciation, becomes $25,909,421.

In 1920, when the city engineer (Mr. O'Shaughnessy) valued the property, he reported to the Mayor and Board of Supervisors that a conservative estimate of the reproduction cost of the property, less depreciation, was not less than $35,000,000, and gave $40,000,000 as a fair price for the city to pay for all of the properties, including the suburban lines. Dr. Wilcox thinks that subsequent events, such as decrease in the rate of traffic development expected, increase in operating expenses and continuance of the 5-cent fare, have had the effect of eliminating all franchise value from the picture. Material prices are also much lower than in 1920, but labor costs are not less. Based on comparisons between historical reproduction new in 1921 and reproduction costs new in 1927, as determined in Los Angeles, Dr. Wilcox estimates the Jan. 1, 1927, reproduction costs new of the Market Street Railway property at $44,756,188. With a deduction of 30 per cent for depreciation, this figure would become $31,329,322.

Dr. Wilcox finds the system, as street railways go, a good property and maintained in good operating condition, but containing considerable "deadwood." By this he means a number of poorly paying lines, kept in service for one reason or another. If the city should take over the property, he thinks it would be a mistake to retain many of these lines in operation.

Last year the Market Street Railway carried 198,030,769 revenue passengers, slightly fewer than in 1925, but more than in 1924, and 6,000,000 more than in 1922, the first full year of operation after the company acquired the properties of its predecessor, the United Railroads. It is paying interest on about $12,000,000 of bonds, but has paid no dividends since 1923. In the opinion of Dr. Wilcox, the company apparently could go on operating as at present under a 5-cent fare and still maintain its solvency for an indefinite period, provided it could hold its wage rate at the present level and its present traffic against the inroads of the municipal railway competition, and could continue its present policy of building no extensions. But if it paid the wages that the municipal lines pay, he thinks its operations would immediately show a deficit before charges.

The testimony of Dr. Wilcox on what the municipal road has done under a 5-cent fare is particularly interesting. The first unit of the municipal railway was placed in operation Dec. 28, 1912. The system now embraces 64.55 miles of track in sole ownership and operation, 5.15 miles of track operated and jointly owned with the Market Street Railway and 4.42 miles of spurs and carhouse track. It owns 224 passenger cars and nineteen buses.

Its total fixed property investment as of June 30, 1927, was $8,969,134, representing the actual cost new of the property, exclusive of materials, supplies and other current assets. Of this amount $300,000 represents funds contributed from taxes and the payment of interest, election and other costs, incidental to the launching of the enterprise. For the balance of the investment, about $8,670,000, the system is now indebted in the amount of $3,295,000 of bonds outstanding. Some of the rest of the original costs have been provided from the earnings, either through original construction or through the subsequent amortization of bond issues. The amount actually provided for accrued depreciation is $3,117,536; of this amount $82,405 has been used for retirements, the balance for new construction.

During the 14½ years of existence its operating revenue and interest income has amounted in the aggregate to $36,088,461. After the deduction of operating expenses and bond interest charges the actual surplus left is $2,834,939. This figure does not include any allowance for taxes, though the city is required by charter to set up for the system "comparison charges" for taxes it is not required to pay, but would have been paid if the system had been operated by a private corporation. These charges amount during the period in question to $3,148,672. With this item charged against earnings the nominal deficit of the municipal railway would be $313,733 for the 14½ years. The author says: "No competent investigator, not blinded by prejudice, could deny that the Municipal Railway of San Francisco has achieved notable financial success under the 5-cent fare. If the municipal railway had been less favorably managed in the past and now had to pay interest on a debt equal to the cost of the property, less the depreciation provided, its interest charges for the last fiscal year would have been $113,000 greater than they were. Also, the municipal railway has increased the wages of its employees, giving them an annual two weeks vacation with pay and provided for employees' pensions, until it can no longer be said that street railway men under the standard established by the city of San Francisco are being exploited either for the sake of profits or in the interest of maintaining a low fare for the benefit of car riders." He thinks, however, that only by substantial economics in the future can this wage scale and the 5-cent fare be retained on the municipal railway and suggests that future amortization of capital be cared for by a special tax on land benefited by good transportation service.

Recommends Cash Offers for Both Lines

Dr. Wilcox's recommendation for the California Street Cable Railroad is that it should be notified that the city will not renew its franchises beyond their expiration date of Feb. 17, 1929, but will give the company $1,000,000 for its operative property, "or in the alternative, the estimated actual cost of the existing units of useful and necessary property other than land, less the depreciation accrued therein from all causes, to be determined by the Railroad Commission as the historical reproduction cost of the structural property, less de-

Digitized by Google

preciation, exclusive of paving, plus the present market value of the land at Hyde and California Streets, as fixed by the Stafford appraisal."

For the Market Street Railway, he recommends the city notify that company that it will not renew any of its franchises when they expire, and that after Sept. 20, 1929, it will not permit continued operation by the company of the lines on which its franchises have expired. This company should be offered $20,000,000 for its operative property, within the city and county of San Francisco, including lines under lease and controlled through stock ownership, "or in the alternative, the estimated actual cost of the existing units of useful and necessary property other than land, less the depreciation accrued therein from all causes, to be determined by the Railroad Commission as the historical reproduction cost method" with deductions and additions as in the previous case. If the company declines to accept either of these alternatives, the city, subject to the approval of the voters, would require the companies to cease operation on the sections whose franchises have expired and to remove its tracks. The city would then take immediate steps to build extensions of the municipal railway on those routes where the city wished operation continued. It would also acquire joint interest on all track still owned by the company, under unexpired franchises, on streets chosen for extensions of the municipal railway.

W., B. & A. Electric Railroad Conducts Prize Quiz

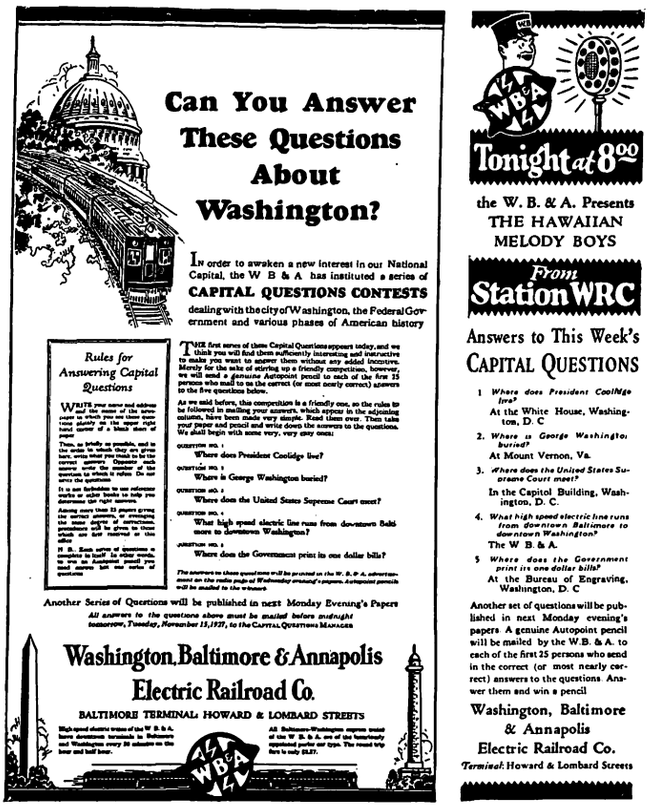
By H. T. Connolly
General Manager Washington, Baltimore & Annapolis Railroad Baltimore, Md.

ONCE more the Washington, Baltimore & Annapolis Electric Railroad, Baltimore, Md., has hit on a novel way of calling attention to itself and its services. The W., B. & A.'s latest idea is to arouse among the people of Baltimore an interest in the various show places of Washington (40 miles distant) by the simple device of asking questions and by offering a few prizes for correct answers. The prizes are modest; they are enameled, metallic pencils. The railway's advertisements have stressed the prizes as little as possible.

The aim is not so much to inspire an increase of tourist traffic from Baltimore to Washington as to associate the ideas of Washington and the W., B. & A. in the minds of all who read the advertisements. This is important, because the road is in active competition for passengers with two steam railroads and a motor coach line.

The questions appear in series of five. The first appeared in the Baltimore evening newspapers of Nov. 14. Simultaneously a letter was sent to school teachers asking them to call the attention of their history and civics classes to the contest. All the questions were as simple and easy as it was possible to make them. All but one suggested some place in Washington worth visiting and that one suggested the means of doing it. Where does President Coolidge live? Where is George Washington buried? Where does the United States Supreme Court meet? Where does the government print its one dollar bills? What high-speed electric line runs from down-town Baltimore to down-town Washington?

A few minutes after the earliest editions of the newspapers had appeared the first set of answers was delivered by the contestant in person. The next day's mail brought more than 500 answers. It had been anticipated that nearly all would be from school children, but a remarkably large number were from adults. It had also been anticipated that the great majority would answer all five questions correctly and notice had been given that, since only 25 pencils were available for distribution, priority would be given to the papers received in the first mail. But though the number of correct papers was well above 25, many others were amusingly inaccurate. It was very significant, however, that all



W., B. & A. advertising in Baltimore papers gave the questions and two days later the answers to the queries along with the regular radio program

knew how to get to Washington by electric train, though, to be sure, this information had been given gratis in the signature of the advertisement.

As far as could be determined, the contestants represented a wide variety of ages, intelligence and social grades. All papers were acknowledged and those who failed to win were invited to try again. To the winners the company sent with the prizes short letters of congratulation. The correct answers were published two days later, concurrently with the program of a radio concert to be broadcast that evening by the W., B. & A. from the Washington station, WRC, in a weekly series which has been conducted for several months with excellent effect. On Wednesday evenings they have been providing homes within reach of station WRC with 30-minute musical performances by the best talent available. Between numbers, the announcer calls attention to one or another advantage of the W., B. & A. service.

The second series of questions was published in the newspapers of Nov. 21. This time the questions concerned the National Zoo, the Library of Congress and the new National Cathedral. Although at the time of writing the returns from this second advertisement had not been tabulated, it was apparent that interest had increased rather than diminished.

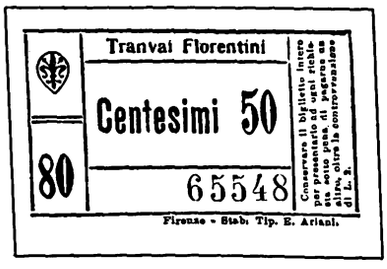
Fronts and backs of various European tickets or fare receipts

In the group above, Nos. 1 to 5 and Nos. 13 to 16 show the backs of tickets, and the others the fronts. The backs, on many European lines, are sold for advertising. No. 1 is from Nice, Nos. 2, 5, 13 and 16 from London, 3 is from Amsterdam, 4 is from Brussels, 14 is from Lido, and 15 from Milan. As will be seen the articles advertised are varied, including clothes, candy, tobacco, furniture, beer, and medicine for the baby. Fronts of tickets are shown as follows: 6 from Dortmund, Germany, 7 from Brussels, 8 from Naples, 9 and 10 from Nice, 11 from Avignon, and 12 from Milan. Especially interesting features in these tickets shown are as follows: In 6, the map of the system for easy punch of destination; in 7, the printing of all names in two languages, French and Flemish; in 9, the issue of a "supplement," or extra fare, when a passenger changes from second to first class, and 11, a surcharged ticket, showing an increase in fare from 10 to 25 centimes.

1



The lower group shows other European street railway tickets or fare receipts. In this group only the fronts of the tickets are shown.

It will be noticed that the rate of fare is distinctly printed on the face of the ticket. Those in the left hand column are from Amsterdam, Lugano, and Milan. That above, in the center, is from Florence. Those in the right hand column are from Rome, Lido, and The Hague.

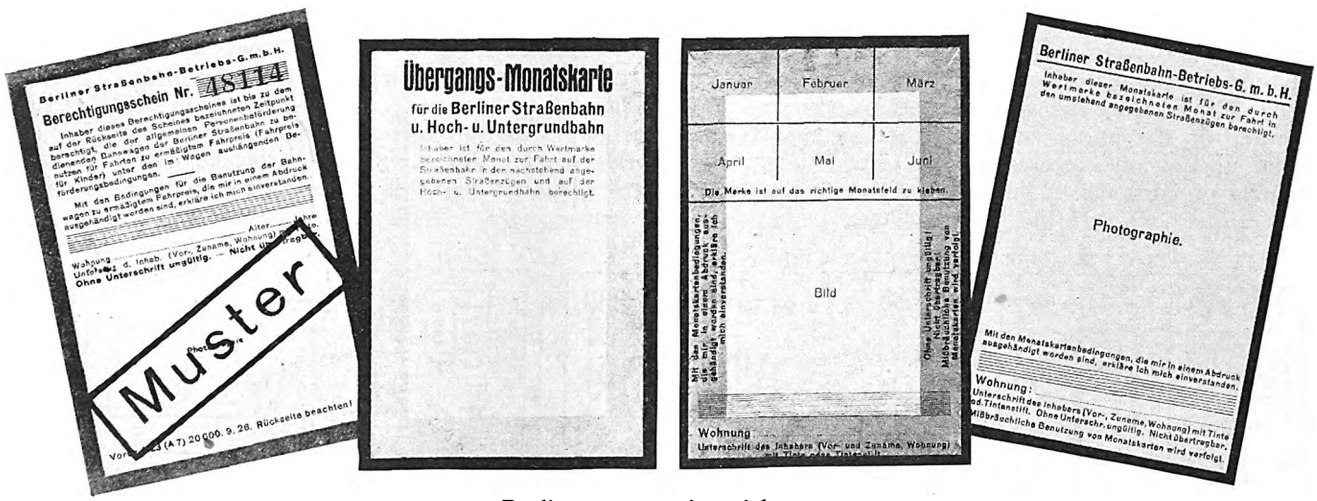
Fares and Fare Collection

in Europe

Some lines charge zone fares, others flat fares. The fare receipt is common, but fare boxes are used on one-man cars. London County Council is pioneering in mid-day fare reductions

By Henry W. Blake
Senior Editor *Electric Railway Journal*



Berlin commutation tickets

Many of the street railway lines in Europe sell tickets for any number of rides within a specified period, good either over the entire system or only over certain routes. The two reproductions in the center are front and back of a monthly commutation ticket, good over the elevated and underground railway and also the surface lines in Berlin. Payments are made monthly for six months, and their receipt is shown by stamps pasted over the squares on the back and canceled. The ticket at the left is sold at a reduced price to students. That at the right is for the surface lines only. All of these tickets require the photograph and signature of the person to whom issued; that is, they are non-transferable. The word "Muster" simply means "sample."

ELECTRIC railway and bus fares are lower in the large cities in western Europe than in the United States, but as a rule the average ride is much shorter than here, and no transfers are given. Berlin is an exception to this rule about transfers, as it gives one transfer for its flat 5-cent fare and puts a time limit on the trip. It should also be remembered that the labor costs of electric railway and bus operation are much lower in Europe than in America. Particulars on this point were given in an article by the writer in ELECTRIC RAILWAY JOURNAL for Aug. 27.

Practice in European street railway and bus fares divides between the zone fare and the flat fare. A report presented at the 1924 convention of the Internationaler Strassen- und Kleinbahn Verein and published in abstract in the issue of this paper for Nov. 29, 1924, showed that on the 47 city roads of Central Europe which reported 22 had flat fares and 25 some form of zone fare.

The same variation is found in the largest cities. Thus, all lines in London, the bus and surface railway lines in Paris and the surface lines in Brussels charge fares on the zone system, but the rapid transit lines in Paris, all lines in Berlin, the railway and bus lines in Milan, Florence and Rome and the trolley in Amsterdam charge a flat fare. The flat fare rate in the spring of this year in the cities mentioned, expressed approximately in American currency, follows: Berlin, 5 cents; Amsterdam, 4 cents; Milan and Florence, 2½ cents; Paris rapid transit lines, 2.4 cents for second class and 4 cents for first class; Rome, on most lines, 2½ cents on weekdays and 3 cents on Sundays, but on two long lines, 4 cents on weekdays and 4½ cents on Sundays.

Under a recent agreement made in Berlin between the city of Berlin and the State Railway System a flat fare will be established between the Berlin Stadtbahn system on one hand and the rapid transit, street railway and bus system on the other. The Stadtbahn, as will be remembered in an article which was published in this journal in the issues of Nov. 5 and Nov. 26, is a part of the State Railway System, on which considerable local transit business is done. It is now being electrically equipped for 800-volt d.c. operation. On the payment of a flat 30-pfennig fare, passengers will receive a free transfer from

Digitized by Google

the Stadtbahn or Ringbahn or from any section of the suburban lines (or Vorortbahnen) to any one of the municipally owned lines mentioned. Later, a half-fare rate for children may be introduced.

The minimum fare per zone for surface lines charging zone fares often varies, as shown in the table on page 1069, reproduced from the posted notice of the Vitry-Concorde line in Paris, being sometimes 35 centimes and sometimes 50 centimes (50 centimes = 2 cents). The same schedule also shows higher rates for first class passengers, a special fare schedule for workmen's return tickets and two schedules for cripples, depending on the extent of their injuries. "Cripples" (*mutilés*) as used here means primarily soldiers crippled during the war. Each car carries a table of this kind, applying to the points reached.

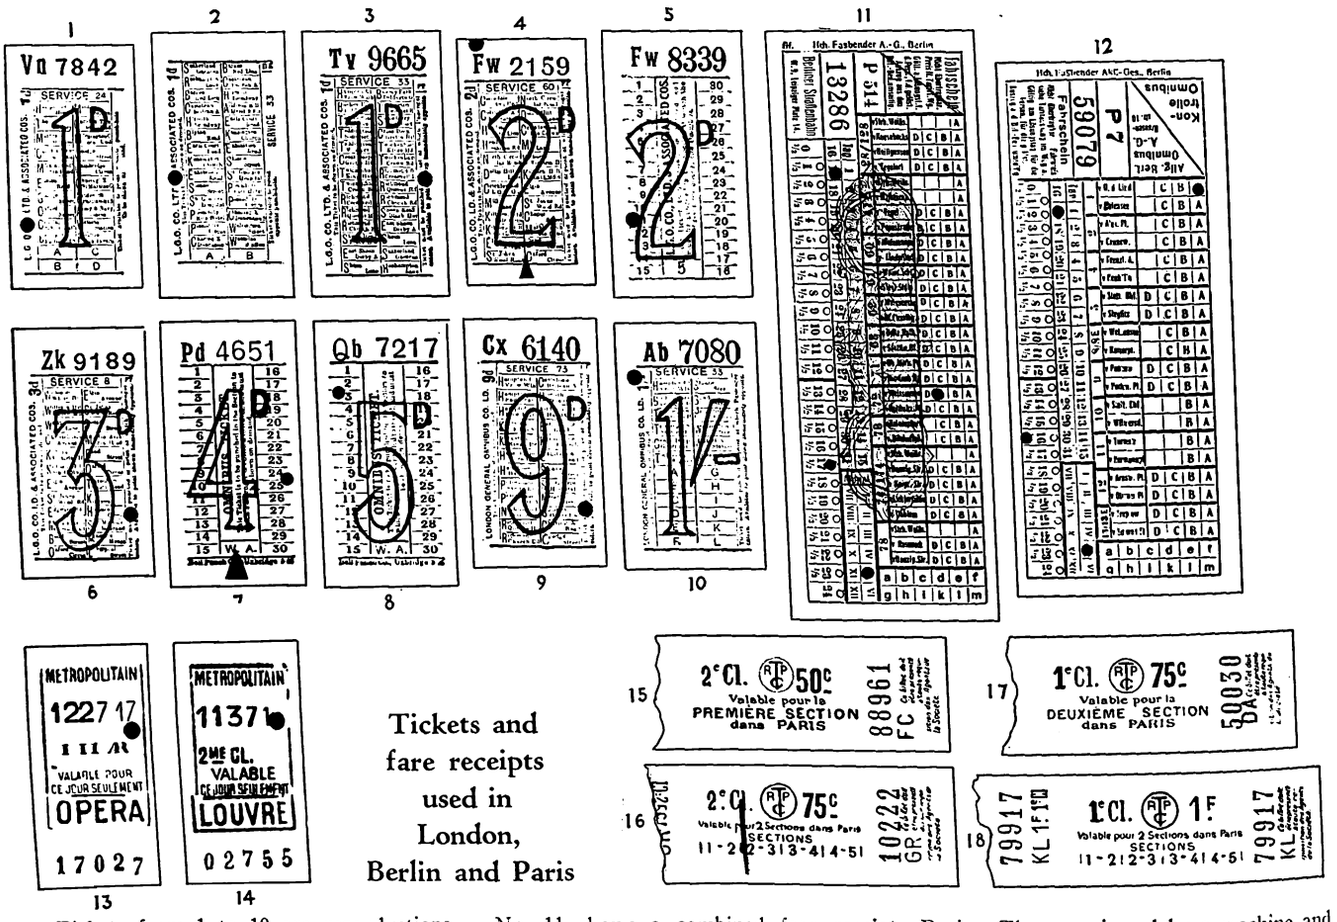
On the Paris bus lines the fare in the first zone is usually 2 cents for second class and 3 cents for first class, with 3 cents and 4 cents respectively for two zones and 4 and 5 cents for more than two zones. The Paris bus lines also have reduced rates for the same classes favored with lower rates by the surface lines.

All Paris trolley and bus fares are based on a higher charge for the initial zone than for each succeeding zone. In London, however, the trolley and bus fares are directly proportional to the distance traveled, so far as this can be done with the policy followed of having the zones end at logical traffic points. These London fares are approximately a penny for about 1¼ miles on the London County Council tramway lines and a penny a mile for the buses.

In addition, the London County Council Tramways has had in force also for several years reduced flat fares, particularly in the middle of the day. Thus, it sells from Monday to Friday for 2 pence a ticket which is good for any distance and is accepted on cars which leave their London (or downtown) termini between 9:30 a.m. and 4 p.m. and on those which arrive at the downtown termini between 10:30 a.m. and 5 p.m. In other words, these time limits are so set as to give the greatest leeway when the passenger goes against the main trend of travel. This 2-penny fare accounts for about 5 per cent of the daily revenue. It is now proposed to sell these tickets on Sunday also.

Other Bargain Fares in London

The London County Council also issues a 1-shilling day pass, good on any day. Originally, this pass was issued on Saturdays and Sundays only, but its use was extended to every day during 1925. On a recent bank holiday 20,000 of these passes were issued at 1 shilling each, making the receipts from this pass amount to approximately 6 per cent of the total receipts, which were about £16,000. Within the last few months the County



Tickets and fare receipts used in London, Berlin and Paris

Tickets from 1 to 10 are reproductions of fronts and backs of tickets issued by the London General Omnibus Company. They represent trips for which charges are made varying from one penny to 1 shilling. As a rule the zone points are named on the ticket, being arranged in double column in such an order that one punch indicates both termini. Sometimes letters or numbers only are used, especially where a large number of zone points would have to be listed.

No. 11 shows a combined fare receipt and transfer ticket issued by the Berlin Surface Lines. It is punched for the day, hour and issuing route. The letters in the lower right hand corner are punched by the conductor of the car to which transfer is made. No. 12 is a corresponding ticket issued by the Berlin General Omnibus Company.

Nos. 13 and 14 are tickets issued by the Metropolitan (rapid transit) Railway in Paris. They are issued by a machine and carry the hour and day of issue, class and name of issuing station. Though a flat fare is charged in each class, tickets are employed to identify the class used.

Nos. 15 and 16 are second-class tickets, one for one section, and one for two sections, issued by the S.T.C.R.P., which operates the surface cars and buses in Paris. Nos. 17 and 18 are the same, but are good for first-class accommodations.

Digitized by Google

Council Tramways has been issuing a similar pass for children at half price, or 6 pence, but the pass is limited to the four months from June to September.

Besides these fares, the L.C.C., like most of the other tramways in Europe, issues a workingman's ticket. This ticket, which is sold to any one who applies for it on the cars before 8 a.m., is a round-trip ticket good for return at any time during the day, for the price of a single fare. On the London County Council lines there is a minimum charge for this ticket of 2 pence. Then there is the ordinary return fare ticket, good on certain lines and sold at the rate of 5 pence for two single 3-penny rides; 6 pence for two 4-penny rides and 8 pence for two single 5-penny rides. There are in addition to the 2-penny flat-fare mid-day tickets the 1-shilling transferable one-day pass and the 6-penny children's one-day pass already mentioned. The London County Council management has been very successful in merchandising these different rates of fare and has tickets to fit practically each combination desired.

As explained, the London single car fare of 1¼ miles for a penny is somewhat less than the London bus fare, which is based on a mile for a penny. Elsewhere in Europe, also, the trolley fare usually is somewhat less than the bus fare, or else for the same fare a longer ride is given by trolley than by bus. Berlin is an exception, the same flat fare (20 pfennigs) being charged on bus, trolley and rapid transit lines with liberal transfer arrangements, but electric railway operation is considered less expensive there than bus operation and the trolley lines are paying a good profit. The large surplus from Berlin trolley operation is used to finance the construction of the rapid transit lines, as both are owned by the municipality.

Incidentally, it might be added that in every city visited by the writer during a recent trip on the Continent, where the bus system and trolley system were operated by the same interests, the trolley was pronounced by the management the more economical per passenger carried and better suited for mass transportation.

Most European electric railways issue season tickets or passes for one week, one month, three months, six months, or (as in Zurich) for a year. These tickets are not transferable like our weekly passes, but can be used only by the person whose name (and sometimes photograph) appears on the card. The charge for these season tickets varies with the number of routes over which they are available. An extended account of the varieties of tickets of this kind sold by the roads in Central Europe will be found in the article already mentioned on page 924 of the issue of this paper for Nov. 29, 1924. Where such commutation tickets are issued the road also usually sells a school commutation ticket at a lower price. Some Berlin monthly school tickets are reproduced. A permit card is also issued to scholars between fourteen and eighteen years old, allowing them to ride at the children's rate.

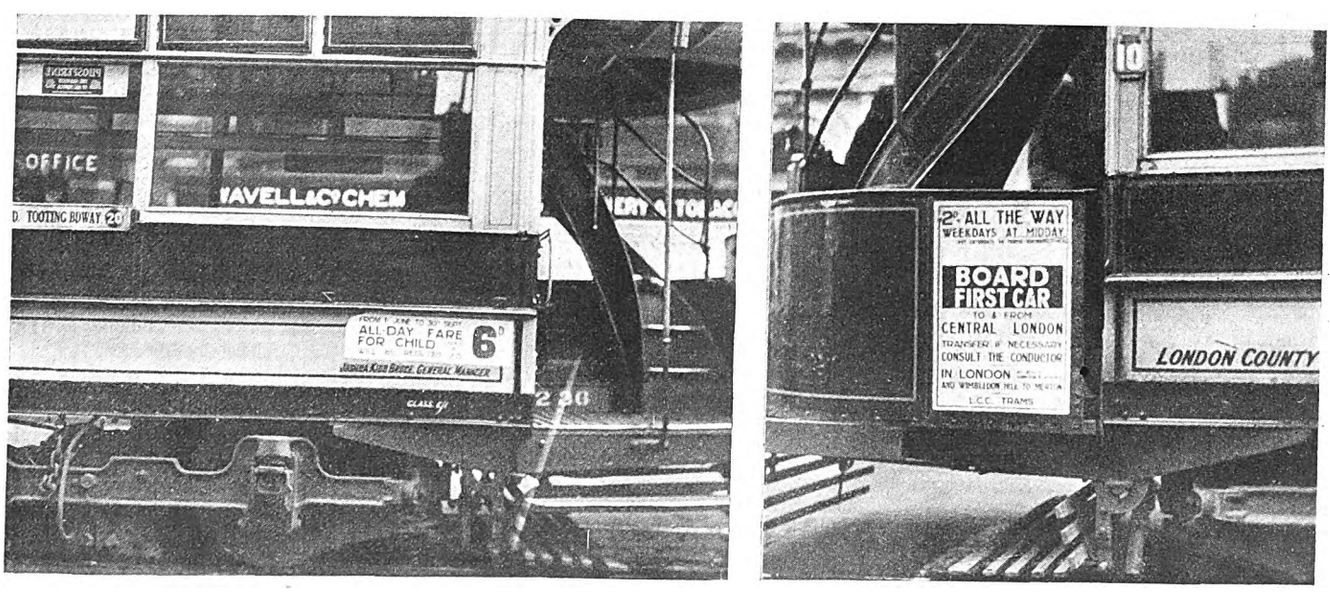
Fare Collection

The almost universal method of fare collection on both street railways and buses is for the conductor to make a trip through the car after each stop and collect fares by hand from the passengers who boarded the car. For each fare collected he issues a receipt, torn serially from a pad, of which the conductor carries several, one for each rate of fare and direction. The conductor's accounts are audited by the number of tickets remaining in the pads issued to him when he started his work.

Where there are many rates of fare, as on a number of the London bus lines where the fares may range by half-penny gradations from a penny to a shilling, the



British managers advertise bargain rates on their cars

Special Tickets of London County Council Tramways

Regular fares on the London County Council Tramways are on the zone system, with a charge of approximately 1d. (2 cents) for 1¼ miles. A number of special cut-rate tickets are issued, however, for various kinds of journeys. Several are illustrated above.

The first (No. 1) is a 6d. return ticket, good at any time during the day for a ride where the single fare would be 4d. The procedure on these lines for the issue and cancellation of return tickets is, briefly, with the exception of emergency tickets, as follows:

At time of issue, if the journey can be made without a transfer, the destination is punched in the lower part of the ticket below the double line. If the journey requires a transfer, the issuing conductor punches the transfer point above the double line, while the conductor on the second car, if it will take the passenger to his destination, punches the ticket below the double line on the same edge of the ticket as the cancellation of the first conductor. In other words, one cancellation below the double line indicates the ticket has been presented to the conductor on a car which will take the passenger to his destination on his outgoing trip.

The practice described is followed on the return trip, namely, for direct journeys cancellation is made below the double line and transfer journeys above the double line, with final punch below the double line made by the conductor on the last car used. Two punches below the double line mean cancellation of the ticket. The date is punched in the margin, in the space provided for it.

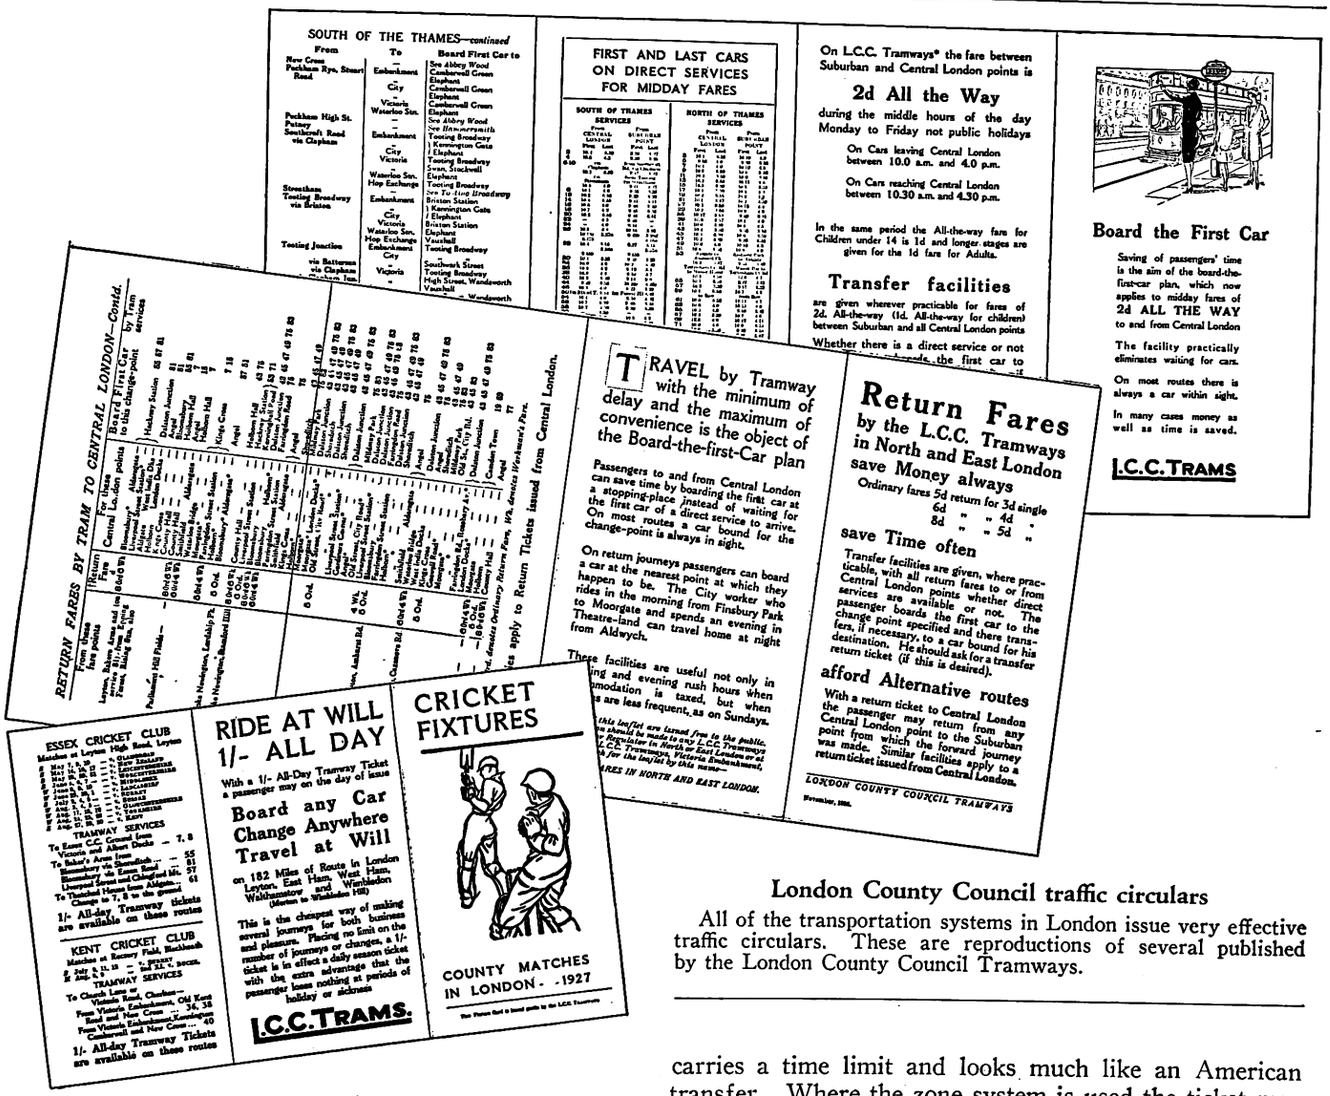
Ticket No. 2 is the famous 2d. flat midday fare. This ticket is good for any distance on cars leaving central London between 9:30 a.m. and 4 p.m. or on cars reaching central London between 10:30 a.m. and 5 p.m. Transfers are permitted and the same system is followed as with the No. 1 ticket, the conductor on the final car punching the ticket below the double line.

Ticket No. 3 is a 4d. workman's return ticket, not greatly different in form from the 6d. return ticket already described, but sold at a reduced rate because the going trip is taken before 8 a.m.

Tickets Nos. 4 and 5 are respectively 8d. and 6d. return tickets of a somewhat different type than the ones already shown, particularly in the method of indicating the date of issue. They are printed for six consecutive week days, the day of the month being punched by the conductor.

Nos. 6 and 7 are front and back of the 1s. all-day pass. These passes are printed good for one-half a month, and the day of issue is punched in one margin. Every time the pass is used, the conductor makes a punch in the canceling margin. The back of the ticket shows the routes over which the ticket is available. These include not only all the lines of the London County Council, but by agreement with certain connecting municipal lines it is good over those lines also.

Digitized by Google



London County Council traffic circulars

All of the transportation systems in London issue very effective traffic circulars. These are reproductions of several published by the London County Council Tramways.

number of pads of tickets which a conductor has to carry is quite large. The supply of these tickets which is required in the stockrooms of the company is correspondingly large. Sometimes the number carried by the conductor is reduced by having him punch the rate, but as another alternative the London General Omnibus Company is trying on one line a ticket-issuing machine. It is swung around the neck of the conductor, just as the customary bell punch is carried. It weighs 4 lb. instead of 2 lb. for the punch.

Often the space on the back of the ticket (or fare receipt) is sold for advertising purposes, thereby bringing in a considerable revenue. The aptness of some of this advertising is illustrated by the reproduction of the back of the bus ticket between Nice and Monte Carlo. It shows a man whose pockets are empty, but whose woman companion says that the pawnbroker Maxima "will advance us some more money on our jewelry."

Every passenger by train or bus is expected to get a receipt for the fare paid by him and to hold it until he finishes his trip. Inspectors occasionally board the car or bus to see that all passengers have fare receipts. When the passenger leaves the car he may throw his receipt away, either on the car floor or on the street.

The form of this kind of receipt is very simple on flat-fare lines which give no transfers, as will be seen from the Italian tickets reproduced. Where a transfer is permitted for the fare paid, as in Berlin, the ticket carries a time limit and looks much like an American transfer. Where the zone system is used the ticket may indicate by type the point to which fare has been paid, as in London and Brussels, or by a map of the system, as in Dortmund, or it may simply carry the words that it covers a certain section or number of sections, as in Paris.

The London General Omnibus Company follows an ingenious method of arranging the names of the different zone limits on its fare receipts so that the conductor indicates both the boarding point and the point to which fare has been paid by a single cancellation. Sometimes the punches used are of the magazine type so as to give another check on the number of tickets issued by the conductor.

A feature of every ticket sold, and this applies to steam railroad tickets in Europe as well, is that it carries distinctly on its face the price at which it is sold. This is usually printed, but occasionally may be punched. This is undoubtedly a great convenience to the traveler and a plan which steam railroads here could copy to advantage. A few railroads print the price on the ticket, as does the Pullman Company, but except for these the purchaser of a railroad ticket in the United States can never be sure that he is not being short-changed, unless he knows the proper charge for his ticket or goes to the trouble of looking it up.

The one-man cars in Amsterdam were the only ones seen by the writer on his recent trip which were equipped with fare boxes.

The rapid transit lines follow the same practice of

Digitized by Google

issuing fare receipts, except that where a zone fare is charged the passenger on leaving the station surrenders his ticket to a station guard, who thereby can check him to see that he has not overridden.

On the flat-fare Paris rapid transit lines tickets are not necessary for this purpose, but are issued to indicate whether the fare paid entitles the passenger to ride in a first-class or second-class car. Ticket-issuing machines are employed, and different colors indicate the two classes. Each ticket is stamped with the time it was issued as well as the name of the issuing station, so it cannot be used a second time.

As there need be no check on overriding on this flat-fare line, the Paris rapid transit passenger is not obliged to surrender his ticket at the end of his trip, but to prevent the stations from being littered with tickets wire baskets are provided near the entrances, into which those leaving the station can throw their used tickets if they wish to. Occasionally baskets of this kind will be seen at important unloading points on surface lines, but they are not common.

On the Berlin rapid transit lines, as explained, the fare receipt issued is very similar in appearance to that used on the Berlin bus and street railway lines. In May of this year, however, the company was experimenting with several ticket-issuing machines.

On the zone fare rapid transit lines in London each ticket not only names the station on the direct line to which the passenger may ride for the fare paid, but also names all the limiting stations on all the connecting lines to which the fare paid entitles the passenger to ride. On a 6-penny ticket this means a larger number of stations.

Most of the London rapid transit stations are equipped with "penny-in-the slot" ticket-issuing machines, from which passengers with the exact change can secure the ticket they want. Thus one machine will issue 1½-penny tickets, another a 2-penny ticket, etc.

Reason for Issue of Fare Receipts

It may appear strange to Americans that European flat-fare lines continue to use a system such as the fare receipt, which has several conspicuous disadvantages as compared with the fare box. One of these is the expense of printing the receipts, though this is sometimes covered, as explained, by the sale of advertising space on the back. Another objection is the expense of inspectors. Another is the litter in the car and on the street caused by discarded tickets. It will appear also to most American managers that the system is slower and more open to abuse by both passengers and conductors than the fare box, though European managers deny this to be the case on their roads.

For zone fare lines there are certain advantages which call for the retention of the fare receipt, as it does afford a definite way of indicating the point where a passenger boards the car or bus and the distance which he is entitled to ride. This is especially useful where the fare zones are short, as they are in Europe.

Probably the main reason for the use of the fare receipt on flat-fare lines is that the public is accustomed to it, both because many of these flat-fare lines formerly charged zone fares and because the fare receipt is in general use in neighboring cities. However, it is not very practicable with one-man car operation, and if that method should spread in Europe the fare box would undoubtedly be more widely adopted. Already the managements of some flat-fare lines are considering the fare box seriously.

As will be seen, the fare system in Europe is by no means standardized. Beside it the straight fare charged in most American cities is simplicity itself. In Europe each system seems to have worked out its fare system independently. Part of the variation is due to law. The low workmen's fare in most cities is an instance. Part can be attributed to compromises made with the city authorities when permission for an increase in fare was obtained. Part has been caused by the spur of competition. In London this competition has been between the city-owned trolley cars on one side and the privately owned buses and rapid transit lines on the other. In all the cut rates put in, however, the great traffic advantage has been sought of giving the reduced rate, so far as possible, only during the non-rush hours or in the direction contrary to the main flow of traffic.

Keeping passengers in line

In Paris a box containing a pad of tickets for queue formation in boarding cars or buses is attached to this standard, upon which is also a stop sign for street cars and buses. A sample queue ticket is shown in the lower left-hand corner.

In America the principal, indeed the only, competitors ever considered are the jitney and the privately owned automobile. Neither of these is a serious factor in Europe, owing to the small proportion of the population which owns cars. It is another matter, however, with bicycles. Especially on the continent of Europe bicycles are a very common sight on city streets, but perhaps more so in Italy and Holland than in France, Germany or Belgium. It is said that in Amsterdam, which is a city of 800,000 inhabitants, there are 200,000 bicycles, and any one who sees them crowd the streets in the downtown

Tables of this kind are posted in all Paris cars

They vary according to the route traversed, showing the fares between different zone points. Notice the difference in fares between regular passengers, workmen, cripples and completely disabled soldiers. The workmen's fares quoted are for a round trip.

section between 8:30 and 9 a.m. will have little difficulty in believing that such a high ratio is correct. In all the continental European capitals they form a serious competitor to the bus and electric car.

Tickets for Queue Formation in Paris

Before the subject of electric railway and bus tickets is dismissed a short reference should be made to the tickets for queue formation used in Paris. At the more important car and bus stopping points there is a pad containing numbers serially arranged, the pad usually being attached to the post carrying the sign which lists the lines passing that point. This pad is used by passengers only when the cars or buses passing that point are crowded and it is evident that only a limited number of additional passengers can be taken on at the next stop. At such times, as intending passengers arrive at the stopping point, each detaches a number from the pad. The passengers are then admitted to the car or bus in the order of their numbers, the lowest numbers coming first. The only exception to this rule of priority is the published regulation of the company which says:

"La priorité est laissée aux aveugles, mutilés de guerre femmes dans une position intéressante ou portant un enfant sur les bras."

Paris was the only city visited by the writer in which this queue system is in use. Even there some of the transportation officials were skeptical about its desirability, but they said it was continued because the public was accustomed to it. It has been employed there for many years, even during the days when buses and cars in Paris were drawn by horses. A queue ticket is reproduced on page 1068 and a pad of these tickets can be seen attached to the pole in the Paris stop sign, illustrated on the same page.

Operator's Nameplate Put on Fare Box

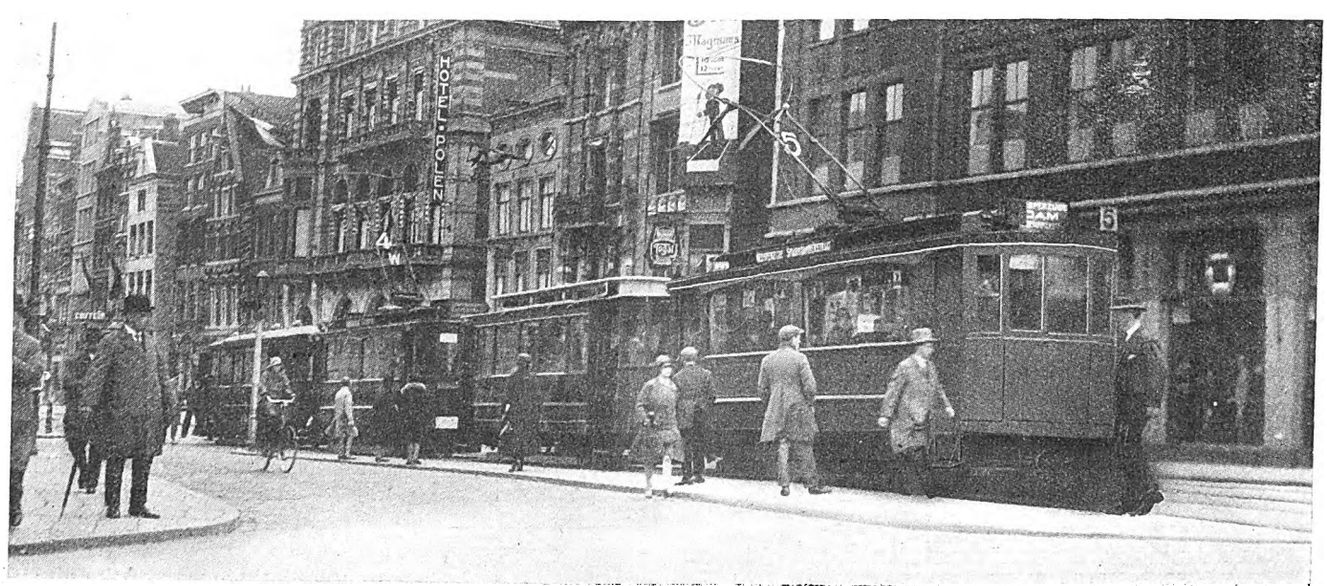
USE of a plate on cars, particularly one-man cars, giving the name of the operator is extending. The practice, of course, is followed also for the clerks serving the public at hotel desks, railroad ticket offices and elsewhere, the thought being that the public likes to know at least the name of the person with whom it is doing business.

Usually the name is painted on a strip of wood which fits into a slide inside the vestibule. The brief of the El Paso Electric Company, El Paso, Tex., presented for the 1927 Coffin Prize discloses that on its railway the name is carried on the fare box.

The nameplates are of brass with polished raised letters. They are about $1\frac{3}{4}$x6 in. long and fit into a special slot on the fare box. Thus the name of the operator is in plain view of all boarding passengers. A light placed over the slot makes the name visible at night.

At first aluminum nameplates were used, but they were discarded in the summer of 1926 in favor of brass plates. It was found that aluminum was not durable enough to withstand the hard usage to which the nameplates are subjected. Being of metal, the plate is not so likely to be mutilated or become unsightly as if of wood, and the highly polished letters of the name can be read easily.

As it is attached to the fare box, the nameplate automatically is always carried at the front end of the car.



Loading platform in the down-town business district of Amsterdam

No traffic is in sight except the street cars and a bicycle. While this absence of street traffic is not a common condition, it is a fact that automobiles are much less in evidence in Amsterdam and other European capitals than in cities of corresponding size in the United States, and that the number of bicycles very much larger.

Maintenance Methods and Devices

Good Use Found for Obsolete Cars

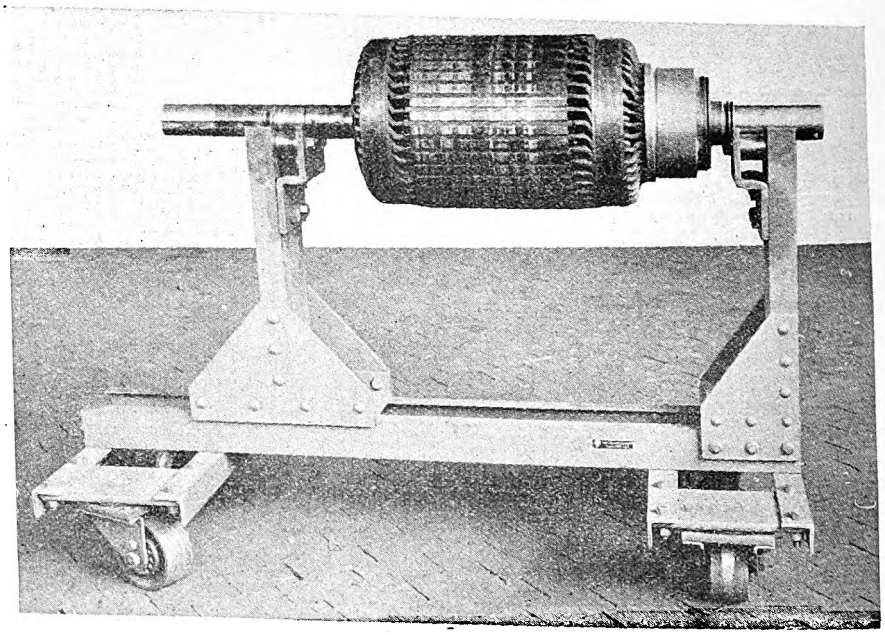
OBSOLETE passenger cars have been put to good use by the Northern Texas Traction Company of Fort Worth, Tex., according to its 1927 Coffin brief. It makes flat cars out of them and uses them to carry gravel. The company owns and operates its own gravel pit. Last year the amount of new construction done was larger than usual and more gravel cars were necessary. It was found that the trucks and brake rigging on two passenger cars about to be discarded were in fair condition, so it made two very serviceable gravel cars out of them by removing the superstructure.

Auxiliary Light for Block Signal

IN ITS brief for the 1927 Coffin Prize the Arkansas Power & Light Company, Little Rock, tells of an attachment to one of its Nachod turnout signals which has been found convenient. This signal is located near the entrance switch from single to double track.

Before the attachment was made the operator of an inbound street car had to look back after he had passed the trolley pan to see that the signal had registered "clear." Sometimes this required him to get off the car to see the signal. Now an auxiliary 110-volt clear lamp has been connected in series with the 110-volt red lamp in the signal so that it will go out when the signal clears. This lamp is mounted within a small box on a pole to the right and in front of the trolley pan. This allows the operator to keep his eyes to the front at all times.

The connection has helped to speed up traffic, and the company is planning to equip all of its signals in the same way.



Portable armature stand with adjustable supporting post

Ball Bearing Adjustable Armature Stand

By Jesse M. Zimmerman
Renewal Parts Engineer Westinghouse Electric & Manufacturing Company

CONVENIENCE in handling armatures of railway motors is had by the combination adjustable portable armature stand shown in the accompanying illustration. One post is stationary, while the other can be moved in or out to fit any size of armature. It is locked in position by a wing nut. The four castors have wide wheels so the truck can be moved about over an uneven floor and are equipped with ball bearings. The pivot bearings are also ball bearing so that the castors will turn easily in the direction the truck is being pushed.

The rollers on which the shaft rests are supported on roller bearings. These rollers turn with the shaft, thereby preserving the journal polish. The truck was designed by the equipment and method department at the Homewood Renewal Parts Works of the Westinghouse Electric & Manufacturing Company.

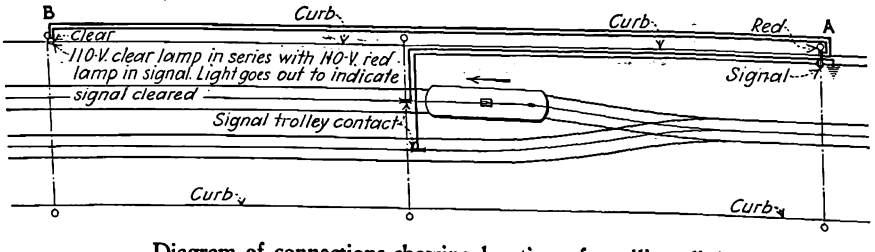


Diagram of connections showing location of auxiliary light to indicate operation of signals

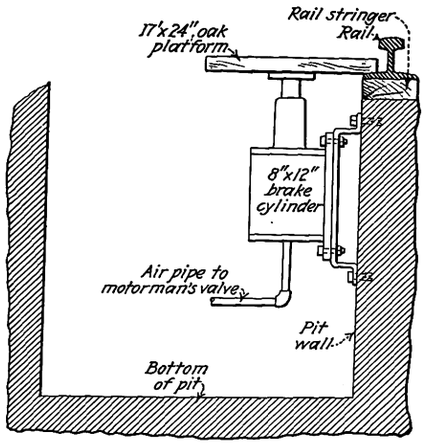
Handling Compressors Pneumatically

REMOVING and installing air compressors was always a slow and tedious job in the Woodside shop of the New York & Queens County Railway, New York City, until a method was adopted to simplify the work. This scheme is shown in the accompanying sketch. Prior to this installation considerable blocking was necessary in order to install or remove a compressor. This blocking is obviated with the new apparatus, which consists of an 8x12-in. brake cylinder installed in the overhauling pit. A 17x24-in. oak platform is fastened to the cylinder piston. Control is by a motorman's valve with necessary piping. The cylinder is bolted to two $\frac{3}{4}$x$2\frac{1}{2}$-in. bars fastened securely to the side wall of the pit and in such a position as to permit the platform to reach the compressor when the piston is near its maximum travel. The platform is designed so

Digitized by Google



This equipment has provided a means for the quick removal and installation of compressors with a minimum of labor

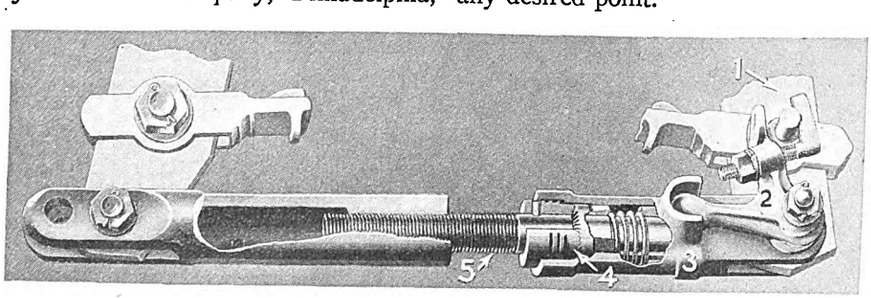
that one side of it will rest upon the rail stringer and below the surface of the rail when the piston is in the full down position. A ¾x2-in. flat bar is installed under the cylinder and fastened to the floor in order to strengthen the installation. The cylinder is operated by a motorman's straight air valve installed on the pit side wall alongside of the cylinder.

To remove a compressor with the new apparatus the car is run to such a position that the compressor is directly over the pneumatic lift. A hand truck is run onto the platform and air is admitted to the cylinder until the truck is lifted into contact with the bottom of the compressor. When the compressor is unbolted the air is released and the truck is returned to the floor level.

New Equipment Available

Improved Type of Slack Adjuster

DEMAND for a device that will function automatically to take up the slack in brake rigging caused the J. G. Brill Company, Philadelphia, Pa., to bring out an improved type of mechanical slack adjuster. This slack adjuster is for installation in the bottom brake rod of a truck. The accompanying illustration shows the various parts. As the brakeshoes wear and the movement of the live lever 1 increases, the adjuster crank 2 on the live lever turns the adjuster housing 3, and with it the sliding ratchet 4, the length of one tooth. As the brakes are released the return movement of the live lever reverses the direction of the sliding ratchet and through the bottom brake rod ratchet increases the length of the brake rod. The use of ratchets makes the adjustment positive and eliminates the possibility of loss by slipping.



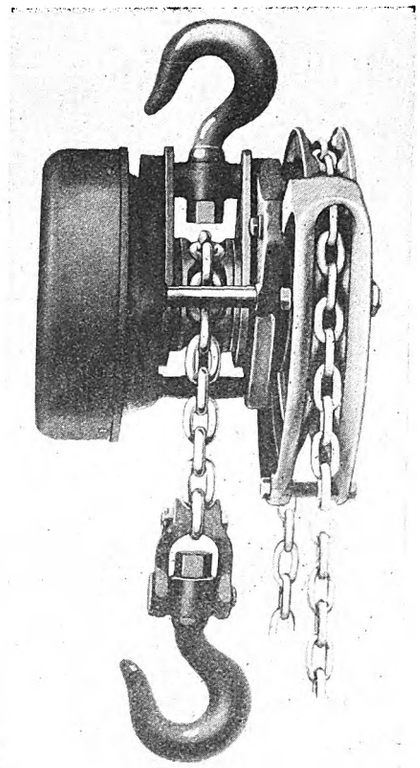
Automatic slack adjuster cut away to show parts

• 1, Live lever; 2, adjuster crank; 3, ratchet housing; 4, bottom brake rod ratchet; 5, adjuster screw.

Your rebabbitted bearing shells, that don't give a tone like a bell, are likely to run as hot as H——

Spun-Geared Chain Hoist

SPUR-GEARED ball bearing chain hoists in a complete line with capacities from ¼ to 10 tons are announced by the Dickerman Hoist Manufacturing Company, Cleveland, Ohio. The steel ball bearings are self-contained, having large diameter hardened and ground balls of high carbon chrome-alloy steel, inclosed in hardened and ground chrome-vanadium steel races. Armored felt washers protect the bearings from dirt, grit and other abrasive matter and also retain the lubricant. By means of ducts the oil is delivered directly to ball bearings and pinion cap bearings. To resist the strain and shock of severe use a one-piece steel load wheel is used. Accurately formed chain pockets in this permit free and easy passage of the chain. The top hook and cross head are steel forgings. Gears and pinions are made from a special alloy and gear teeth are cut from machined blanks. An automatic brake holds the load at any desired point.



Spur-geared ball-bearing chain hoist

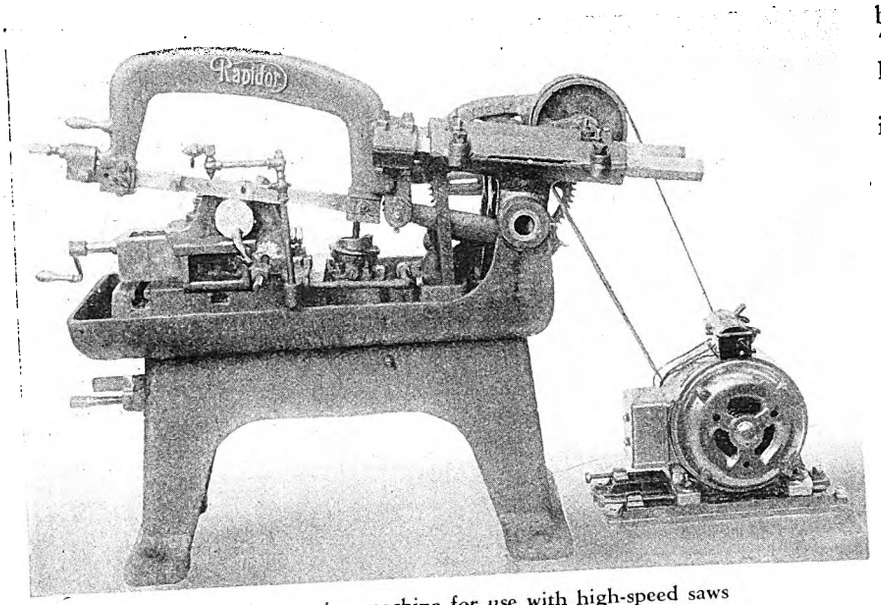
The gear arrangement is of the planetary type. An endless chain passes over the handwheel, which turns on the screw hub of a ratchet friction disk. This is keyed to a one-piece driveshaft and pinion. The pinion meshes with two gears held diametrically opposite each other in a pinion cage. Integral with these gears are intermediate pinions that mesh with a large internal gear and serve as a fulcrum to rotate the planetary gear.

A pull on either side of the hand chain loop causes the drive pinion to rotate the gears in opposite directions, thus causing the pinion to travel around the internal gear, revolving the pinion cage and load wheel, thereby raising or lowering the load.

High-Speed, Heavy-Duty Metal Saw

MAXIMUM output can be obtained from high-speed steel blades, it is said, with a new metal sawing machine placed on the market by Edward G. Herbert, Ltd., Manchester, England. This machine can run at 200 strokes a minute, which provides a cutting speed of 200 ft. per minute. This is nearly double the usual maximum speed of a hacksaw machine. When run at 200 strokes per minute with a Rapidor H.S.S. blade, this machine will cut

Digitized by Google



Heavy-duty sawing machine for use with high-speed saws

3-in. diameter mild steel bar in an average of three minutes and twenty seconds. When sawing 3-in. diameter brass bar under the same conditions 100 cuts can be made between sharpenings and the average time per cut is 45 seconds. These outputs are in advance of previous designs of hack-saw machines.

Quick operation is a particular feature of the new design. The saw blade is strained by turning a handle and a patent tension indicator shows when the blade is strained correctly. All operations and adjustments are controlled from one position in the front of the machine. On the three-speed machine the speed changes are made by a handle at the front.

In operating the machine the pressure on the blade is not altered after adjustment. This is unnecessary, because when a blade is dulled, instead of adding pressure and forcing it to cut, it is taken out and resharpened. The vise, of the heavy-duty screw type, has a loose jaw which swivels for holding taper work. The screw is fitted with a ball thrust washer, which lessens the effort required from the operator when fixing work. A control device makes it possible to start on sharp corners without damage to the blade.

The new saw is made from machine-molded castings. Rotating shafts are ground to size and run in renewable phosphor bronze bearings. The main slides are adjustable for wear. The crank and frame pins are hardened and ground. Grease gun lubrication is used.

Motor-driven machines have speed-reducing gearing and the motor can be fixed on slide rails on the floor behind the machine. If portability is required the motor can be bolted to the body of the machine. All gearing is machine cut and guarded.

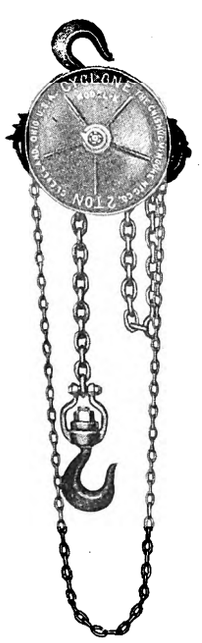
Long Life Feature of New Hoists

IMPROVEMENTS in the new Model K Cyclone hoist manufactured by the Chisholm-Moore Manufacturing Company, Cleveland, Ohio, include an increased efficiency of 90 per cent, as against 80 per cent of previous models. Particular attention has been given to providing a material and construction which will give long life. Among the changes is the addition of anti-friction bearings at every rotating point. Altogether eight ball bearings, four roller bearings and one Timken thrust roller bearing in the lower swivel hook are used.

One of the most important changes is the use of four eccentric roller bearings. In previous models the rollers of these bearings were loose and had to be fitted carefully into their cage at the time of assembling. In the new model these roller bearings are built in one complete unit, which does away with loose rollers.

Another improvement includes the use of a new steel alloy of extreme hardness. This gives exceptionally clean and accurate chain pockets and reduces the wear at that point. All parts are made interchangeable, so it is possible to assemble them in the hoist quickly without regard to rights or lefts. Center punch marks or other generally accepted means for indicating the correct position are not necessary.

The entire mechanism is inclosed in a dustproof, oil-tight frame. This feature makes possible a minimum of attention for the hoist as it needs only to be packed with grease once a year under ordinary use. The hoist being exceedingly light, it is possible to carry it easily from one job to another. Exceptional efficiency is a feature.

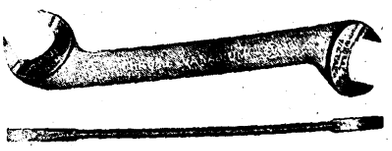


New type of cyclone hoist

Your weak and run-down armatures say "for heaven's sake" treat me to a "dip and bake."

Thin Wrench for Brake Adjustment

HEADS of but $\frac{7}{32}$ in. in thickness feature a chrome-vanadium wrench announced by the Bonney Forge & Tool Works, Allentown, Pa. The extreme thinness makes the wrench easier to use in adjustment



New thin model wrench

of Lockheed brakes, the adjusting nuts of which are not readily accessible to ordinary wrenches.

The new wrench is a double-ender with $\frac{5}{8}$-in. opening at each end for the $\frac{7}{16}$ S.A.E. adjusting nuts. One opening is at 22½ deg. and the other at 60 deg. to the handle.

Association Activities

Pennsylvanians Meet at Scranton

Well-attended meeting of Pennsylvania Street Railway Association is addressed by President Stevens of the A.E.R.A. and prominent railway men of the Keystone state

IMPROVEMENT in transportation service was the general subject discussed at the annual convention of the Pennsylvania Street Railway Association held Dec. 1 and 2 at Scranton. R. P. Stevens, president of the American Electric Railway Association, chose "Service" as the theme of an address made at the banquet Thursday evening. He stressed the extreme importance of maintaining good relations between the electric railway companies and the public. H. S. Metcalfe, assistant to the president West Penn Electric Company, talked along somewhat similar lines on the same occasion. Prior to the presentation of the addresses of the two principal speakers, Thomas Davies, secretary to Mayor E. B. Jermyn of Scranton, welcomed the convention delegates to the city.

The feature of the afternoon session was a discussion of traffic congestion and its causes by R. C. Haldeman, president Pennsylvania Motor Federation, who emphatically condemned automobile parking.

Another paper presented by W. T. Rossell, general manager Pittsburgh Railways, discussed the need for better organized supervisory methods on electric railway properties, while J. W. Shaw, Philadelphia Rapid Transit Company, spoke on co-ordinating all transportation facilities under a single management. These papers will appear in abstract in a future issue.

Developments in Car Design Discussed by Engineers

Recent improvements in car design were discussed in a talk by George Frey, assistant general sales manager J. G. Brill Company, Philadelphia, Pa. He described in detail the novel features of the Brill model 1928 car, which was exhibited at the Cleveland convention last October. His talk was illustrated with a number of views of this car and its mechanism. The double reduction gear drive on the model 1928 car was discussed by George Woods, railway engineer Westinghouse Electric & Manufacturing Company. He said that four objects had been sought in the design of this drive: First, faster acceleration; second, greater spring support; third, low floor height, and, fourth, quiet operation. In his opinion considerable success has attended the effort to accomplish these objects. J. C. Thirlwall, General Electric Company, called attention to the fact that these new designs are still in the experimental stage.

Many of the brickbats thrown at street railway companies were fully deserved, according to H. S. Metcalfe, assistant to the president West Penn Electric Company, speaking at the annual banquet. In their infancy and through their early years, he said, public utilities in general and street railways in particular developed habits that in many cases have grown with them. Even though there have been sincere attempts to discard the evils of yesterday, those records have not been and will not be forgotten. Franchise evils, the abuses of monopoly, watered stock, ancient equipment, a "public-be-damned" policy and irregular service are all blotches upon the record of street car companies.

Likening the street railway industry to a leopard, Mr. Metcalfe remarked that it is infinitely easier to get spots on than to get them off. However, many of the spots are fading away, he said, and there is a new appreciation of the necessity and worth of street railway service abroad today. A real desire to render true public service is foundational if the mistakes of the past are to be eradicated and this program must begin with the management of the street railway, be conveyed by it to the employee group and interpreted by both management and employees to the public.

Mr. Metcalfe stated that promises without performance are piffle and that all high-sounding statements made by street railway executives amount to nothing more than wind unless service and equipment adequate for every community are provided. In an attempt to change the leopard's spots in the street railway business a willingness to face facts with candor is needed, recognition must be given to the difficulties which arise from acute competition due to the private automobile, an honest endeavor must be made to meet existing conditions and overcome them, and through the whole program an optimism born of faith in future success must be manifested.

Reports of the secretary and treasurer and of the various committees were presented at the Friday morning session. New officers were elected and installed. A moving picture showing how automobile tires should be cared for was presented by the Firestone Tire & Rubber Company.

New Officers Elected

Officers chosen for the coming year are: President, H. L. Mitchell, president West Penn Railways; first vice-president, J. E. Wayne, vice-president and general manager York Railways; second vice-president, H. F. Dicke, vice-president Lehigh Valley Transit Company; secretary, H. A. Buch, Harrisburg; treasurer, C. F. Crane, assistant to the president Harrisburg Railways. The new executive committee will consist of Thomas Cooper, Westinghouse Electric & Manufacturing Company; C. F. Crane, Harrisburg Railways; S. S. Crane, Altoona & Logan Valley Electric Railway; H. H. Dartt, Scranton Railway; Thomas Fitzgerald, Pittsburgh Railways; A. R. Myers, Erie Railway, and W. A. Woolford, General Electric Company.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Jan. 16-17—Midwest Electric Railway Association, Hot Springs, Ark.

Jan. 18-19—Kentucky Association of Public Utilities, annual meeting Brown Hotel, Louisville, Ky.

Jan. 18-19—Central Electric Traffic Association, Hotel Gibson, Cincinnati, Ohio.

Jan. 25—Central Electric Railway Master Mechanics' Association, Hotel Gibson, Cincinnati, Ohio.

Jan. 25-27—Electric Railway Association of Equipment Men, Southern Properties, Roosevelt Hotel, New Orleans, La.

Jan. 26-27—Central Electric Railway Association, Hotel Gibson, Cincinnati, Ohio.

Jan. 31—New York Electric Railway Association, annual meeting, Hotel Commodore, New York, N. Y.

American Association News

Next Convention City to Be Decided

A JOINT meeting of the committee on policy and the sub-committee on convention contract will be held at association headquarters at 10 a.m. Dec. 16 to decide upon the location of the 47th annual convention. J. P. Barnes, first vice-president of the association, is chairman of the committee on policy and Frank R. Coates, past-president of the association, is chairman of the sub-committee on convention contract.

Engineering Committee Appointments

BESIDES the committee appointments in the Engineering Association already reported special committee No. 9 of the Power Division is announced. In addition, Morris Buck, New York, N. Y., has been appointed to the committee on subjects, and L. W. Birch, Mansfield, Ohio, has been appointed to the committee on heavy electric traction vice M. W. Manz, resigned.

The personnel of the new committee follows:

POWER DIVISION—SPECIAL COMMITTEE No. 9—CONDUIT SPECIFICATIONS

A. J. KLATTE, electrical engineer Chicago Surface Lines, Chicago, Ill., chairman.

R. B. W. PECK, New York, N. Y.
W. J. QUINN, New York, N. Y.
E. F. NORTON, New York, N. Y.
HARVEY WOOD, New York, N. Y.
R. B. PATTERSON, Washington, D. C.

Rolling Stock Committee No. 3 —Car Design

MODERN cars must be designed to provide faster schedules with increased acceleration and braking rates, was the general opinion of members of special rolling stock committee No. 3 on car design, which met at association headquarters, New York City, Nov. 30. Those present were H. H. Adams, chairman; O. W. Basquin, J. A. Brooks, C. A. Burleson, W. J. Clardy, L. J. Davis, Charles Gordon, W. L. Harwood, A. P. Jenks, A. L. Kasemeier, G. L. Kippenberger, John Lindall, W. R. McRae and H. S. Williams. In addition to the preceding members of the committee, there were also present at the invitation of the committee N. R. Brownyer of the Timken-Detroit Axle Company, E. R. Fitch of the Westinghouse Air Brake Company, C. W. Squier of ELECTRIC RAILWAY JOURNAL, and Guy C. Hecker of the association staff.

To obtain suggestions as to desirable work that could be undertaken by the committee and the scope of any investigation or tests that should be made, each member was invited to comment on desirable data that should be collected. The general opinion was that in particular two problems should receive attention, first the mechanical problem of studying technical characteristics of various types of drives that are now being incorporated in several improved trucks, and second, a study of features that are needed to meet modern transportation conditions. Some of the essential factors that the committee thought should be considered are light weight, comfortable seating, faster acceleration and braking rates, and faster schedules. With some of the new designs brought out, rates of 3 m.p.h.p.s. for acceleration and braking can be used without discomfort to passengers.

In discussing this phase of the problem, it was generally agreed that smoothness of acceleration is an important factor in connection with any increase made. Jerky acceleration is liable to result in an increased number of accidents from people falling inside cars. Some members of the committee felt that a study of floor coverings should be made in connection with any recommendations for increased acceleration or braking rate. The committee decided that an efficiency test of gearing should be made to obtain preliminary test data throughout the life of the gear. A subcommittee was appointed to obtain an estimate of expenditures necessary for complete tests, the time required, and to outline a desirable procedure in order that the test should be uniform and give desired information.

The committee also decided that an analysis of the advantages and disadvantages of new truck designs recently brought out should be made in comparison with conventional truck designs, and a sub-committee was appointed to compile, by correspondence, a complete comparison of the various new truck designs with trucks of corresponding capacity of the conventional type sold by each manufacturer. The purpose of the collection of these data is not to determine the relative merits of any of these trucks but rather to give the committee a complete comparative analysis of the design so that it can visualize better the possibilities and limitations of the radical developments that have taken place in the last year.

A study of the desirability of so-called de luxe features in cars for a large city, small city and an interurban property was discussed and it was the feeling of the committee that attention should be devoted to the study of this subject. Another phase which some members of the committee felt should receive attention was that of determining the elements in construction and painting which have a desirable or undesirable effect upon the general appearance of cars.

Purchases and Stores

PLANS for the special committee work were discussed at the first meeting of the standing committee of the new Purchases and Stores Division of the Engineering Association held at association headquarters, New York, on Dec. 6.

John Y. Bayliss, chairman, presided. W. J. Walker was elected secretary and A. A. Ordway vice-chairman. The session was largely devoted to the presentation by special committee of preliminary reports on the subjects recommended for consideration during 1928. There was a discussion of the desirability of handling certain of the work of the division in co-operation with the stores accounting committee of the Accountants' Association. There was also a discussion of the possibility of having a joint session with the accountants at the 1928 convention. R. A. Weston, chairman of the stores accounting committee was in accord with co-operative work and a joint convention session.

A program committee to formulate plans for the session on purchases and stores at the 1928 convention was appointed consisting of J. Y. Bayliss, chairman; J. Fleming, W. E. Scott, C. A. Harris, A. A. Ordway and R. A. Weston.

Those in attendance at the meeting were: J. Y. Bayliss, Richmond, Va.; A. S. Duncan, East Pittsburgh, Pa.; A. L. Fischer, Cincinnati, Ohio; W. E. Scott, Philadelphia, Pa.; A. A. Ordway, Boston, Mass.; J. Fleming, Washington, D. C.; W. J. Walker, Schenectady, N. Y.; E. A. Murphy, Indianapolis, Ind.; R. A. Weston, New Haven, Conn.; W. P. McArdle, New York, N. Y.

New Association Bulletins

FOLLOWING is a list of special reports that are being prepared by the bureau of information and service of the American Electric Railway Association, and that will be available to member companies on request:

Bulletin No. 173.—Wages of Employees Other Than Trainmen.—A new edition of the association's regular bulletin on wages of employees other than trainmen, showing for about 250 companies the classification of employees and the wages paid each class in the shop, barn, way and structures, carhouse, overhead line, stores, bus maintenance and garage departments. It also shows the number of hours worked weekly, the average weekly wage earned, overtime rates, and the number of employees in each department.

Bulletin No. 174.—Special Reduced Rate Tickets.—A tabulation showing whether or not companies are required to give reduced transportation rates to children, students, workmen, or any others, based on a survey of nearly 300 companies. Where reduced rate transportation is required by law, the table shows what rates are specified and whether or not tickets are sold on the cars and, if not, where they may be purchased.

Bulletin No. 175.—Rate of Return Allowed Electric Railways.—Extracts from decisions of public utility commissions on which the rate has been fixed after official determination of the amount upon which the company is entitled to earn a return. This is a new edition of Bulletin No. 96, issued on Aug. 1, 1926, and includes decisions handed down since that date. A second part has been added showing rates of return established in franchises.

Bulletin No. 176.—Free Transportation on Electric Railways.—Shows for 338 electric railway companies whether or not they grant free transportation to policemen, firemen, letter carriers, employees and members of employees' families. In addition there is shown whether or not such free transportation is required by law and, where this is the case, the nature and extent of the requirement.

In addition to the above the following supplements have been prepared, bringing the information they cover down to Dec. 1, 1927:

Supplement No. 2 to Bulletins Nos. 163 and 164.—*Electric Railway Fares.*

Supplement No. 3 to Bulletin No. 160.—*Wages of Trainmen.*

Supplement No. 3 to Bulletin No. 161.—*Wages of Bus Men.*

Cost of Living Studies (Bulletin No. 177).

Under New Auspices

Riding public informed of management change in St. Louis. Work of receiver publicly recognized

OPERATION of the lines of the United Railways, St. Louis, Mo., was started at midnight Nov. 30 by the St. Louis Public Service Company. So far as the riding public was concerned there was no appreciable change. Motormen and conductors wore hatbands with the name of the company and in addition the conductors had silk badges with the inscription "We Start Today." Each passenger upon entering the car was handed a folder entitled "All Aboard." The lead article was headed "We Make Our Bow." On the outside of all the cars were signs reading: "Now! This Street Railway System is Operated by the St. Louis Public Service Company." Inside the cars were other signs telling of the change in management. On some of the cars the old "U.R." on the outside had been replaced with the words "Public Service" painted in orange on a black background. Other cars will be so marked as quickly as possible.

The old United Railways tokens will be used for the time being, while the supply of transfers on hand when Receiver Rolla Wells turned over the properties will be utilized and transfers with the name of the new company probably will not appear for about a month.

Full-page advertisements were inserted in all of the St. Louis newspapers headed "Today We Make Our Bow." The body of the advertisement was as follows:

Beginning today the St. Louis Public Service Company is operating the railway system of St. Louis and St. Louis County. Service will be maintained without interruption and for the present there will be no changes affecting patrons.

In assuming the responsibilities that go with the maintenance and operation of this great transportation system we wish to recognize, with keen appreciation, the good physical condition of the property as it is turned over to us by the receiver, Rolla Wells, Col. A. T. Perkins, his manager, and staff.

The St. Louis Public Service Company begins its management of the railway with a thorough understanding of the growing transportation needs of this community. The new management includes men of training and long experience in the operation of railway properties. These men have been assisting in the reorganization and are familiar with the property.

The St. Louis Public Service Company assumes the task of serving the public. This service must be of such a character that it will win both the good will and patronage of the citizens of this community. It will be the policy of the new company to determine the character of service desired by the public and then to supply that service with the understanding that the public will gladly pay the fare necessary to maintain it.

Frank criticism and constructive suggestions will be invited. It is only through a mutual understanding of the problems involved that complete confidence can be built up. The St. Louis Public Service Company pledges itself to do everything possible to establish that confidence, so that a cordial relationship may exist between the patrons and its transportation system.

Subway Items in Budget Hit

Supreme Court Justice Wasservogel has handed down an opinion granting a peremptory writ of mandamus to William Jay Schieffelin against Mayor Walker of New York, the Board of Estimate and others on the application of the Citizens Union for elimination from the 1928 city budget of a $13,000,000 appropriation for amortization of the first instalment of rapid transit stock for the new independent subway system.

The New York *World* says:

Whatever the outcome of this litigation, it has already become evident that the Delaney plan is unworkable. Mr. Delaney asked for an initial budgetary allotment of $20,000,000, which was to be quadrupled within four years. It was found that the first $20,000,000 could not be provided without raising the tax rate or else curtailing expenditures for other purposes. The city administration naturally shrank from either alternative and consequently was compelled to reduce the first appropriation to $13,000,000. The setback which this plan has received in no way interferes with the unification program now in preparation by the Transit Commission. Instead, it rather emphasizes the need of the economies of unified service as the way out of the muddle.

Readers, What Have You?

NEW YORK Public Library, 42d Street and Fifth Avenue, New York City, wants to complete its volumes of *Street Railway Journal*, the predecessor of this paper. It is making an appeal to us to help find the missing numbers. It lacks the following:

Vol. 1—November, 1884, to October, 1885.

Vol. 2—November, 1885, to October, 1886.

Vol. 3—November, 1886, to December, 1887.

Vol. 4—January, 1888, to December, 1888.

Vol. 5, No. 1—January, 1889.

Vol. 5, No. 6—June, 1889.

Here is your chance to contribute to an institution national in character, and noted as a reference library, the numbers it needs to complete its file of information about the activities of this industry.

Another Jitney Move in Detroit

State Supreme Court refuses to reopen case there which debars parasites from principal thoroughfares

THE Michigan Supreme Court on Dec. 1 refused to reopen the hearing conducted before it last year involving the right of jitneys to operate in Detroit. It is believed that the state court's action, which also included the dissolving of all jitney injunctions, blocks any possible new attempts to get the case back into that court. It dissolved its own injunction previously existing against the enforcement of the ordinance. The legal battle between the city and the jitney organizations has extended from 1922, when the ordinance was passed ruling the jitneys off certain principal streets over which they operated. Since that time court actions of various kinds have prevented the enforcement of the ordinance and the jitneys are still operating.

Corporation Counsel Charles P. O'Neil is awaiting the receipt of the official Supreme Court order before taking any steps to enforce the ordinance. The jitney organizations base their hope for the future on the temporary injunction issued more than a year ago by Circuit Judge Harry J. Dingeman, restraining the city from enforcing the ordinance. Judge Dingeman is now ill, and it was announced by the Corporation Counsel that if the State Supreme Court's order does not dissolve the Dingeman injunction the quickest way to end the injunction will be sought.

The ordinance was first held invalid by the Circuit Court, but on an appeal to the State Supreme Court by the city, that court found it sound. A later motion by Edward N. Barnard, counsel for the jitney drivers' associations, was denied. State Supreme Court Justice John Bird later signed an injunction temporarily restraining the city from making the ordinance effective. Then the matter was carried by the attorney for the jitneys to the United States Supreme Court on constitutional grounds. The city appealed to the full State Supreme Court following the order of Justice Bird and not only lost the appeal but was ordered not to enforce the ordinance until further instructions were received from that court.

Court actions against the jitneys, which are believed to make Judge Dingeman's injunction ineffective, include the state court's action in holding that the ordinance is valid, the denial for one motion for a rehearing and the denial of a recent motion by the jitney organizations for leave to file a motion for rehearing. The United States Su-

Digitized by Google

preme Court has also thrown the case out on the ground that it has no jurisdiction, no federal question being involved.

It has been announced by Mr. Barnard that the jitneys will continue to operate until the injunction is dissolved and that the matter will be appealed to higher courts on new grounds that have arisen since the first appeal.

"Narrow-Gage" Will Be Electrified

Hemphill & Wells have purchased the Boston, Revere Beach & Lynn Railroad. New owners plan to give suburbanites de luxe transportation

ELECTRIFICATION plans for the Boston, Revere Beach & Lynn Railroad, popularly known as the "narrow-gage," have been divulged by Gardner F. Wells, new president of the railroad, which was recently purchased by Hemphill & Wells of New York City, an engineering and management organization. The organization also operates the Interstate Street Railway of Attleboro, Mass., and the Poughkeepsie & Wappingers Falls Railway, serving Poughkeepsie, N. Y.

The purchase of the stock of Karl C. Adams, president of the road, amounting to more than 5,000 shares of the outstanding 8,500 shares, at $137.50 a share, was effected through a holding company known as the Eastern Railway Associates, Boston, according to Boston newspaper reports.

Following a complete engineering investigation, the board of directors, consisting of Daniel P. Abercrombie, Charles A. Collins, Albert W. Hemphill, Walter P. Simonds, Gardner F. Wells and George W. Wells, issued the following statements concerning the electrification and the financing of the improvements:

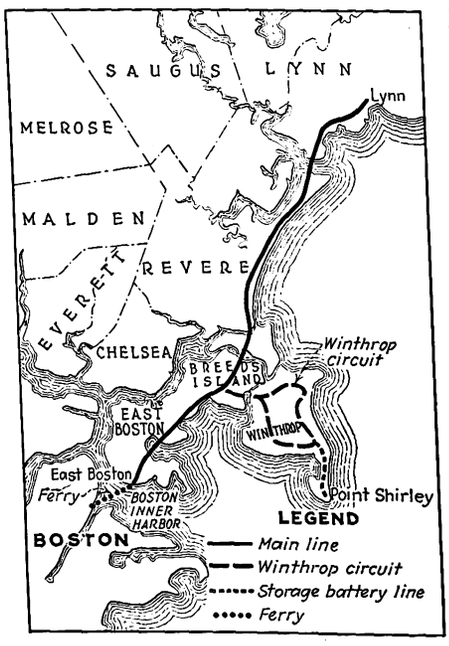
"In order to give the patrons of the road the benefit of improved service, more expeditious movement of trains and modern, efficient methods of operation, with resulting advantage to the company and to the traveling public, the necessary steps will be taken to electrify the company's line and to install such other improvements and equipment as in the judgment of the general managers will most effectively promote the rendering of speedy, efficient and satisfactory service.

"In order to finance the proposed improvements and for other corporate purposes, the directors recommend to the stockholders that they authorize immediate application to the Department of Public Utilities for authority to issue 1,700 additional shares of stock, and $1,000,000 of general mortgage bonds of the company."

Application will be made to the Department of Public Utilities for authority to issue eventually 11,900 additional shares of stock and $1,000,000 of general mortgage bonds, but of the additional stock it is planned to issue only 1,700 shares immediately, authority with respect to the balance being desired for future refunding purposes.

"Subject to the Department of Public Utilities for the security issue necessary to finance the undertaking," stated Gardner F. Wells, "the new management will carry forward its plans to electrify both the 12-mile double-track main line between Lynn and the East Boston ferry terminal and the Winthrop loop line.

"The 3-ft. gage will be retained on the entire system, totaling 34 miles of single track. The complete program will cost more than $1,000,000 and includes the purchase of new car equipment, remodeling of all stations, installation of an overhead system and the construction of substations.



Main line of the Boston, Revere Beach & Lynn Railroad from Lynn to the East Boston ferry and the Winthrop loop

"The cars to be used will be of the de luxe type, modern in every respect and comfortable as well as attractive. The seats are to be individual type, leather upholstered. The cars will be mounted on special narrow-gage Brill trucks, with 50-hp. special-design motors and control equipment for multiple-unit operation. They will be designed so that trains of any number of units, from one to ten, can be operated.

"Catenary type overhead will be installed to distribute the 600 volts direct current to be used on the system. The overhead system was selected rather than the third rail because of the many cuts and marshes on the road and because of the trouble which would accompany the heavy winter snows. Two permanent substations and one portable substation will be used to distribute the electrical energy, which will be purchased from local central stations.

"All passenger stations will be repainted and remodeled. The prepayment system is to be used so that selling tickets at the stations and collecting them on the trains will be eliminated.

"The company plans to give the patrons a high-speed electric service which will prove much more satisfactory than any given heretofore. Trains will operate at more frequent intervals and with greater elasticity.

"Electric trains will provide not only a faster ride but also a cleaner ride. This feature will be appreciated particularly in the tunnels on the road, where the smoke from the steam locomotives has proved in the past a nuisance to the patrons and a problem to the owners."

Steam Operation Began Over Half Century Ago

Since July 20, 1875, more than half a century ago, the "narrow-gage" has been operated to the great convenience and advantage of residents of the North Shore between Boston and Lynn. Its beginning was a humble one, for the company's entire rolling stock included three locomotives and eleven cars. On the first day of operation the trains carried 1,078 passengers. The fare from Boston or Lynn to Revere Beach was 10 cents, making the fare between Boston and Lynn 20 cents. In 1891 the company absorbed the Boston, Winthrop & Shore Railroad, which it made the Winthrop branch. This road was a similar narrow-gage passenger line with a route of 4.7 miles from East Boston to Winthrop and one of 12.6 miles from Crescent Beach to Point of Pines, Revere. Although the line paid no dividends when operated by an independent company, it proved profitable as a branch of the Boston, Revere Beach & Lynn Railroad.

The first president of the railroad was A. P. Blake. In 1891 Col. Melvin O. Adams became president and took over the executive management of the railroad. Upon the death of Colonel Adams, six years ago, his son, Karl C. Adams, succeeded as president and executive manager of the railroad, so that the railroad has been sort of a "step-child" of the Adams family.

Road Experienced A Rapid Growth

Tunnels were put through the hills in East Boston in the '90s and a new terminal was built with a drop and ferry slip. During the same period the 5-cent fare was introduced, making the total fare from Lynn to Boston only 10 cents. The number of passengers increased by leaps and bounds and increased carrying capacity was demanded. The cars were enlarged and the locomotives were built heavier and larger. Today, after a half century of operation, the company has 26 locomotives and four big, modern ferry boats. Through its long period of operation the road has continued to pay dividends, a rare accomplishment for any railroad.

Another Move to Restore Railway Service in Columbia

A manufacturer of buses with a branch office at Atlanta, Ga., recently made a definite proposal to the City Council of Columbia, S. C., to operate the street cars of the Columbia Railway, Gas & Electric Company in connection with the buses now run there. The proposition was made by attorneys representing the manufacturer and the Carolina Transit Company, which originally operated the buses in Columbia. Some time ago the bus maker, creditor of the Carolina Transit Company, took over the operation of the buses.

According to the proposal, the bus maker will organize a company with a capital of $250,000 to take over the bus lines and the railway equipment, now idle in the carhouse, and run the two in conjunction.

The suggestion is conditioned on several points, namely, that a proper arrangement can be made with the Columbia Railway, Gas & Electric Company, owner of the railway system, whereby the new company will have conveyed to it the franchise of the old company; that a contract can be arranged to furnish the new company with power at a reasonable rate for a period of ten years; that the City Council enforce the ordinance regarding the operation of jitneys on the streets of Columbia, an ordinance now before the South Carolina Supreme Court; that all litigation concerning the railway system be terminated, and that the Council use its efforts in securing a reduction of the taxable value of the railway system as it appears at the present time and that the Council relieve the system of any obligation for street paving which now exists by virtue of ordinances passed heretofore.

According to the proposal, the manufacturer believes that at the beginning of operation by the new company some 25 or 28 pieces of equipment, including cars and buses, would be in operation on the streets of the city. The Columbia Council has taken the proposal under consideration.

After the street cars were withdrawn last March several actions were started in the courts to compel the restoration of trolley service. Disposition of these has not yet been made. The jitneys also instituted proceedings relative to the constitutionality of an ordinance which required the jitneys to operate over a certain prescribed route and on regular schedule. This matter is also before the courts.

At present the jitneys, carrying passengers for 10 cents, operate over any streets they see fit, cease operations when they so please and offer a competition to any other form of transportation that can hardly be met. Buses too are operated on a 10-cent fare. The jitneys, carrying passengers direct to their doors, have so reduced the patronage of the buses that the latter can hardly keep on operating indefinitely.

The outcome of the latest move to restore railway service in the capital of South Carolina is said to be very problematical.

Successful Bidder for Staten Island Equipment Not Decided

No decision has been made on the public auction sale of trackless trolley cars and trolley cars which took place at the office of the Department of Plant and Structures of the city of New York on Dec. 5. The equipment was first offered in separate parcels and then in one lot. R. W. Marshall, New York, was the high bidder for the separate parcels and H. E. Salzburg & Company, Inc., New York, was the high bidder for the material to go in one lot. A decision on the disposition of the equipment will be made soon. The equipment that was sold was used by the city in service operated by it on Staten Island.

From Exclusive Brighton to Downtown Rochester by Tube

Rochester's $12,000,000 subway in the bed of the abandoned Erie Canal was opened on Dec. 1, with local shuttle service and interurban cars operated by the New York State Railways. There was no official ceremony, but thousands of persons used the line on the first day. A bursted water main held up operation for three hours, but that was the only incident to mar the beginning. The shuttle line provides local high-speed service between Winton Road at the eastern end of the line to City Hall, in the heart of the downtown district.

Rochester & Eastern interurban cars have been diverted from the city streets at Monroe Avenue and are now running in the subway through the city, greatly relieving the traffic congestion problem.

The New York State Railways also is providing freight switching service to industries along the subway line.

Because installation of signals has not been completed, the maximum possible speed is not yet in effect on the railroad.

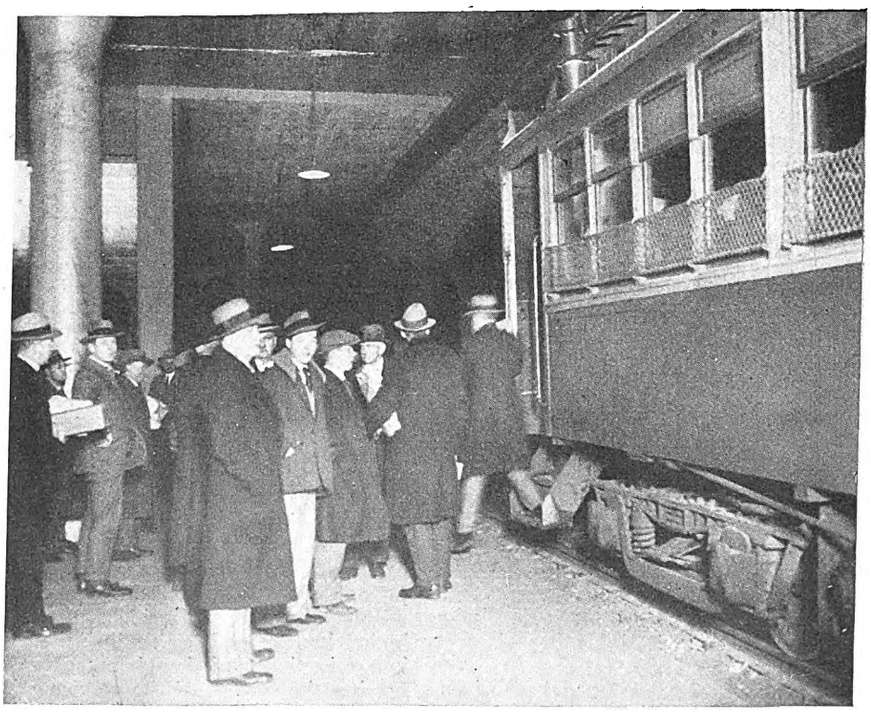
The shuttle service is maintained on approximately a half hour schedule, starting with a running time of eleven minutes from Winton Road to City Hall. This speed, City Railway Commissioner Barnes announced, would be cut considerably when signal installation is finished and the operators are more familiar with the tracks.

The fare on the subway is 9 cents within the limits of the city and 5 cents additional outside.

The shuttle service provides a much needed means of rapid transportation for commuters from the suburb of Brighton. All trolleys make stops at the following stations: City Hall, Court Street, Meigs Street, Monroe Avenue, Culver Road, Colby Street, Winton Road, Highland Avenue, Elmwood Avenue and Rowland's Loop.

The first interurban car leaves City Hall station at 6:10 a.m. and the last one departs at 11:10 p.m. A 30-minute schedule is maintained in the rush hours and hourly otherwise. The local service starts at 6:15 a.m. and stops at midnight.

The subway, running from Oak Street on the western edge of the city and ending at Brighton, an exclusive residential suburb, will be operated by the New York State Railways for a three-year trial period under virtually the same terms as those of the service-at cost contract under which city railway and bus service is maintained.



First commuters arriving at City Hall station following the opening of Rochester's new $12,000,000 subway

Chicago parties fail to agree on arbitration board member. Matter pending since last July

The failure of Judge Kickham Scanlan, representing the street car men's union, and E. J. McIlraith, Chicago Surface Lines' representative, to decide upon a third member of the arbitration board which was approved by both parties on July 19, has resulted in some public discussion. Names of some 25 different persons have been submitted to both members, but the majority have been flatly rejected.

Officials of the local union are said to feel the companies have been remiss about carrying out their part of the arbitration agreement. Mr. Mahon, president of the Amalgamated Association of Street and Electric Railway Employees, is expected to arrive in Chicago this week for the purpose of deciding what action is best. The Chicago Rapid Transit Company trainmen have agreed to be governed by any arrangement reached by the Surface Lines negotiations.

The negotiations for a new wage scale date back to June 1, when the last wage agreement expired. At that time, the Surface Lines employees demanded an increase of 15 cents an hour together with the $20 weekly sick benefits and $1,000 in life insurance, which had been granted to the Rapid Transit Line employees last year. The street railway companies subsequently countered with a proposal to reduce wages 5 cents an hour, maintaining that wages and working conditions in Chicago were the highest and best in the country and that present business conditions justified a cut rather than an increase. The arbitration agreement, which was adopted in July after six weeks of parleying, during which the trainmen voted to authorize their union officials to call a strike if necessary, admitted both the company's and the union's demands as subjects for mediation.

Federal Judge James H. Wilkerson announced that inasmuch as the Chicago Railways is under his jurisdiction, because of receivership proceedings, he might summon the companies and the union representatives before him should the situation become acute. The Chicago Railways represents approximately 60 per cent of the city's street railway mileage.

Fare Hearing in St. Paul on Jan. 5

The postponed hearing by the Minnesota Railroad and Warehouse Commission of the application of the St. Paul City Railway for an increase in car fare, now 8 cents cash or six tokens for 40 cents, is set for Jan. 5, 1928. The former date was Nov. 14, 1927. Judge T. D. O'Brien and W. H. Oppenheimer have been retained by the St. Paul Association of Public and Business Affairs to aid Corporation Counsel Arthur A. Stewart to represent the city. The company alleges it is not receiving the 7½ per cent set by the commission as a fair rate of return on the company's property valuation. The city and association will oppose any increase in fare.

Careful New Jersey Operators Will Receive $130,000

Approximately $130,000 will be paid to operators of railway cars and buses under the no-accident bonus plan put into effect Dec. 3, 1926, by the Public Service Railway and Public Service Transportation companies of Newark, N. J. The object was to provide an additional incentive to careful operators and the further promotion of safety. With the expiration of the first year's trial of the plan the operators will be paid, beginning Dec. 12, by which time the complete records will have been computed. The plan called for the payment to operators of bonuses for good accident records.

The plan will be continued for another year under revisions which will give the operator more frequent returns for his efforts. While Vice-President Boylan says that it is difficult "to determine whether it has brought the return in accident reduction which this large expenditure warrants," neverthless, believing the great majority of men have tried to co-operate, he has decided to try it again. Under the new plan the year will be divided into three bonus periods as follows:

First period to run from December, 1927, to March, 1928; second period from April to July, 1928. third period, from August to November, 1928. Bonuses will be paid for each period as follows: To operators having a perfect record, $20; to those having one accident, $19; to those having two, $17,-50; to those having three, $15. Those having more than three accident will not be entitled to any bonus. In addition, an extra $20 will be paid to those having perfect records for the three periods. Bonuses will be paid during the first month following the expiration of a period.

In addition a carhouse or garage bonus will be awarded to the carhouse or garage in each division which makes the best showing in each bonus period. The record will be based on a comparison of the number of accidents per 100,000 car-miles during each bonus period, with the record for the corresponding four month of the previous year. This bonus will be $5 for each operator assigned to the winning carhouse or garage on the last day of the bonus period.

Those eligible to bonus participation are regular or extra operators engaged in passenger service who work 95 days in any bonus period. Any operator failing to report an accident of which he has knowledge becomes ineligible for bonus in that period and any operator leaving the service of the company before the final day of any bonus period forfeits his right to any bonus for that period.

Suspended Railway Proposed for Montreal

In an attempt to solve the problem of traffic congestion on the Island of Montreal, Canada, a plan for the transportation of passengers new at least to Canada is now being studied by the chief engineer of the Montreal Tramways Commission, who has been instructed by the commission to report on it.

The system, in brief, may be described as an overhead railway which differs from the ordinary elevated system in that the cars, instead of running on tracks, are suspended like baskets from a specially designed running beam. The designer, W. E. Hamilton, with the assistance of his son, C. Harold Hamilton, has devised the scheme for the peculiar conditions of Montreal. As described the proposed system is apparently similar to the famous suspension monorail over River Wuppur at Elberfeld, Germany.

A report on the proposed system is now being prepared for the chairman of the Tramways Commission. In the meantime the plans are undergoing constructive criticism at the hands of various tramway and railway officials to whom the scheme has been presented by the designer.

Work Started on Important San Francisco Line

Mayor Rolph of San Francisco, Cal., broke ground on Nov. 24 for the Judah Street car line, which is to tap the Sunset district. Sunset residents gathered in jubilation over the long-looked-for line of the San Francisco Municipal Railway. After a brief program of speechmaking the contractors began work on the line. It is expected the road will be completed by Feb. 15.

Date Fixed for Subway Bids in New York

The Board of Transportation of New York City announced recently that it would receive bids on Dec. 30 for construction of another section of the new subway system in Brooklyn, running along Manhattan Avenue from Nassau Avenue to Greene Street, in the Greenpoint district. The contract is the third advertised this month for bids on subway construction work in the area between McCarren Park and Long Island City.

Bids on the section in Long Island City from Arch Street to Queens Street, to form the junction of the Queens Boulevard and Brooklyn cross-town routes at the connection with the 53d Street tunnel to Manhattan, were to be received by the Board of Transportation Dec. 9. On Dec. 21 the Board of Transportation will receive bids for the section along Manhattan Avenue, under Newtown Creek, and along Vernon and Jackson Avenues from Freeman Street, Brooklyn, to Arch Street, Queens.

New Franchise Modern in Terms Wanted in Grand Forks

Unless a new franchise not so exacting as the present one is granted to the Grand Forks Street Railway, Grand Forks, N. D., by the City Commission the company will go into liquidation as the stockholders will not be willing to continue longer with a proposition that is paying no dividends and shows no prospects of being a paying investment.

Urging immediate consideration of the matter, by the Council a representative of the company stated that the annual meeting of stockholders would be held on Jan. 11, and a 60 days notice of the matter of applying for a new charter had to be given the stockholders. Unless there is some assurance of the company being relieved of the cost of paving, counsel explained that there was no use in trying to obtain a majority vote of the stockholders for the renewal of the state charter.

Baltimore Fare Testimony Concluded

Testimony has been concluded before the Maryland Public Service Commission on a petition filed by the United Railways & Electric Company, Baltimore, Md., for permission to increase the car fare from 7½ cents to 10 cents. Lawyers on both sides have been requested to file briefs with the commission. Final arguments will then be heard.

Fare Increase Sought in Wichita

The Wichita Transportation Company, Wichita, Kan., has filed with the City Commission a request for a new twenty-year franchise and an increase in fares for its electric railway. The company wants street car fares the same as fares for buses, single 8 cents and on down with 24 fares for $1.50. Early in the present year the system at Wichita passed into control of local interests.

Ten Cents in Council Bluffs

The report of the master in chancery which granted the request of the Omaha & Council Bluffs Street Railway for a 10-cent fare in Council Bluffs, Iowa, was recently affirmed by Judge Martin J. Wade. The present fare on the railway line is 7 cents. The city of Council Bluffs fought the attempt to gain a 3-cent boost, contending that the old 5-cent fare was a sufficient and just charge.

In his statement Judge Wade decried the fact that Iowa had no statute providing for the regulation of electric railways. Nearly all other utilities were regulated by public bodies, he pointed out, but under the Iowa law no public body had the power to fix rates and regulate service of a railway. Expressing his impatience with the situation in Iowa with reference to fixing the rates for elecric railways, he said in part:

I have sat for hours almost without number in these cases—the Des Moines street railway, the Ottumwa case and others—in which eminent counsel have talked for hours about the fixing of electric railway rates. For years there has been discussion, but nothing else, about having the power to fix rates conferred upon a commission, or upon the railway commission, or upon the City Council, all without results.

"Borrow Books" Suggested to Cincinnati Employees

All employees of the Cincinnati Street Railway, Cincinnati Ohio, are urged by the management to take advantage of the invitation of Chalmers Hadley, librarian of the Public Library of Cincinnati, to visit the library and borrow some good books and magazines, which really belong to all taxpayers. With time and material on hand the company asks in the *News*, its official organ, "Do we want more pleasure in living and a wider knowledge of the world and its people? We will have only ourselves to blame if we do not use our public library." Mr. Hadley explained in a letter to the company how easy it is to get books.

Another Sensation in Grand Rapids

With city officials, railway experts and mechanical engineers as special guests, the Grand Rapids Railroad, Grand Rapids, Mich., gave the final tests to the new Versare six-wheel electric railway coach a few days ago and placed the new vehicle in regular service for experimental purposes.

With the distinguished company on board the coach was run over the company's lines so they might appreciate the riding qualities, quick acceleration, quick braking and other factors that are sought in meeting present-day traffic conditions. Included in the party were Mayor Elvin Swarthout, City Manager Fred H. Locke, City Consulting Engineer Gerald J. Wagner, City Engineer C. W. Darling, Director of Public Service W. A. Sperry, Director of Public Welfare A. E. Davidson, Safety Director James Sinke, Vice-President and General Manager L. J. DeLamarter of the railway and these representatives and experts representing the industry: O. F. Warhus, vice-president of the Versare Corporation, Albany, N. Y.; W. H. Beattys, Jr., Chicago; J. S. Y. Fralick, Chicago; K. A. Simmon, Pittsburgh; J. C. Morrell, Pittsburgh; P. L. Hermann and W. N. Mohr, Detroit; N. M. McKibbin, Detroit; A. D. Wood, Chicago.

The new coach, developed after two years work by the Grand Rapids Railroad and the Versare Corporation, has been very favorably received by the public.

Philadelphia Electrification Ready by June

Electrification of the line of the Pennsylvania Railroad from Philadelphia to Wilmington and the Octoraro branch to West Chester, via Swarthmore and Media, will cost approximately $11,000,000. The Wilmington line will be completed early in June, 1928, and the West Chester line is expected to be in operation in August. It has been announced that installations of electrical equipment on 128-passenger cars for operation on these lines is practically completed. The electrification of these two lines is part of the railroad's plan now being actively developed for the construction of the new main passenger terminal on the west bank of the Schuylkill, a subway extension under Filbert Street and an underground station for suburban trains at Fifteenth Street and the Parkway. All suburban trains will be electrified for operation in the subway.

Vote Asked on Long Beach, Cal., Proposal

D. W. Pontius, vice-president and general manager of the Pacific Electric Railway, has proposed to the city of Long Beach, Cal., that there be a vote of the people on the three alternative transportation propositions recently presented to Long Beach. In his letter to the city authorities, Mr. Pontius says:

We ask that at the next election, if you do not feel one should be called for this particular purpose, you place on the ballot for the consideration of the voters these three propositions:

Shall the offer of the Pacific Electric Railway to serve the city of Long Beach with local service by unified operation of street cars and buses be accepted?

Shall the Lang Transportation Company's offer to operate local bus service in the city of Long Beach under a 2½-year permit be accepted?

Shall the city of Long Beach establish and operate its own municipal bus service in the city? (If this is carried affirmatively a bond issue will be necessary and will have to be considered at a later election).

The City Manager disagrees with Mr. Pontius concerning the necessity of a bond issue for inauguration of a municipal system of buses. He thinks it can be financed otherwise.

New Identification Signs in Topeka

With the advent of the new year, Topekans will be able to identify the cars of the Topeka Railway, Topeka, Kan., from afar. New 6-ft. boards with signs telling the destination of the car are to be affixed to the upper part of the cars on either side, indicating the town on which line the car is operating. The signs are to be decorative as well as beneficial to the riding public. At present Topeka street cars carry signs only in front.

Recent Bus Developments

Accounting Order Expected in Pennsylvania in January

Promulgation of an order relating to bus accounting effective Jan. 1, 1928, is probable by the Public Service Commission of Pennsylvania. To this end there was a public hearing before the commission in Harrisburg on Nov. 15. At previous informal conferences, all motor carriers and others interested in the subject were permitted to submit criticisms, amendments and changes.

Several of those who spoke mentioned preference for the classification adopted in 1926 by the National Association of Railroad and Utilities Commissioners and by the American Electric Railway Accountants Association in 1925.

Except for a few instances the Pennsylvania classification follows the fundamentals of the other. Depreciation, however, is not considered a part of maintenance expense, but is set up in a group with amortization of other capital following "other general expenses." The title of this new group is to be "Depreciation and Amortization." Operating expense groups are arranged in the following order: Conducting transportation, maintenance, traffic, general administration expenses, other general expenses and depreciation.

The classification as drawn applies to bus companies, taxicab companies and to trucks when they are an incidental part of passenger operations.

Common carriers are divided into four groups, and for the first three, a classification has been drawn. Class A applies to carriers having an average annual operating revenue of more than $250,000, Class B from $50,000 to $250,000, Class C from $10,000 to $50,000 and Class D, of less than $10,000, for which no classification is prescribed.

Higher Bus Fares in Kansas City Under Consideration

The Kansas City Public Service Company, Kansas City, Mo., is considering raising bus fares and eliminating at least three non-paying bus lines, as it is considered by company officials that this is the only means by which this branch of the public carrier system can be continued in operation. It is expected that these changes will be incorporated into a new franchise now being studied and which will be submitted to the City Council at the expiration of the present grant June 1, 1928.

The Armour-Peaso line, according to Fred G. Buffe, vice-president of the company, is the only one of the nine in operation to show a profit. Operation of the present bus system for the past three years has cost the company $526,636 more than the total receipts. The average operating cost for each mile is placed at 27 cents, compared with the average receipts of 24.4 cents a mile. Officials of the company believe that a cash fare of 15 cents with two tokens for 25 cents will show a proper return on the money invested. In addition to the increased rate, it is planned to use the buses for the most part only during rush hours. The Winchester, Leeds and South Troost lines, because of the poor showing they have made, are slated for discontinuance. They are said to show a loss of approximately 10 cents a mile. In 1926 the system operated at a loss of $307,302 and so far this year the loss has been $134,530.

From Pasadena to the Pacific at Long Beach

The Pacific Electric Railway, Los Angeles, Cal., has applied to the Railroad Commission for a certificate of public convenience and necessity to operate auto stage service between Pasadena and Long Beach over a route specified in detail in the request to the state body.

Fewer Cruising Taxis in Philadelphia

Experiment in regulation under co-operation of state body and city authorities. Diamond and Cunningham cabs pass to local railway

ON DEC. 12, or shortly thereafter, a plan will be put into effect in Philadelphia which it is expected will serve still further to relieve street traffic congestion. It relates to the regulation of the cruising taxi. Its narrow downtown streets greatly complicate the problem of traffic congestion in Philadelphia. Last winter congestion became so acute that car and bus riders of the Philadelphia Rapid Transit Company were seriously inconvenienced. Cruising taxicabs in the central business district naturally add to the volume of traffic.

The Yellow Cab Company felt for a long while that if the cruising problem could be satisfactorily solved the traffic situation would be helped considerably. Accordingly the Pennsylvania Public Service Commission appointed a committee of cab operators, one from each of the four most prominent companies, to report a plan to eliminate the cruising practice. The commission has now approved this report, and the City Council has passed an ordinance authorizing the establishment of the additional 176 cab stands in the central section.

Plea Made for Cruising Cabs

The committee representing the cab companies held numerous conferences, but it was apparent at the outset that continuation of intensely competitive methods among rival cab companies would make impossible any effective regulation of cruising. Moreover, the two smaller companies—the Diamond and the Cunningham—felt that they would suffer material losses in revenue if forbidden to cruise, since their revenue is derived almost wholly from this source. This obstacle, however, was removed by the agreement of the Philadelphia Rapid Transit Company to purchase and merge them with the Yellow Cab Company under terms to be submitted to the commission for approval.

Full consideration was given to the valuable service which the cruising cab now provides to the riding public by making this form of transportation readily accessible in the busiest sections of the city. However, the committee believed that the plan which it submitted, while reducing to a minimum the interference of the taxicab with moving traffic, will at the same time increase its usefulness as a public carrier by making it even more accessible to prospective riders.

Expansion of Present Cab Stand Idea

At present there are fifteen regular cab stands in the district affected by the new plan, with accommodation for 60 cabs. In addition about 540 cabs are now cruising in the downtown streets at the peak hour. It was recommended that the present stands be retained and that 176 new stands be established with accommodation for 384 cabs. The number of cabs within the district in the peak hour will thus be reduced from approximately 600 to 444, or about 25 per cent. The feeling of the committee was that these cabs will give a better service than is now possible, since they will be distributed more nearly in accordance with traffic requirements and will be stationary except when in actual service or when returning to a stand. In so far as possible these stands are placed at such frequent intervals that any prospective rider can get a taxicab at the nearest street corner.

Telephones will be installed at each end of 159 of the proposed 191 stands, one connecting directly with the Quaker switchboard and the other with the Yellow switchboard. These phones will be available to the public without charge.

Yellow and Quaker have agreed that the two companies shall have equal rights at all stands and that the stands will also be opened to any other cab company or individual cab owner operating under certificate of convenience

Digitized by Google

from the Public Service Commission. Cabs bringing riders from the residential district to the business section will, after discharging their passengers, proceed to the nearest telephone stand and report by telephone to the dispatcher. Cabs carrying riders out of the business district will be replaced by additional cabs dispatched from garages as needed. During the peak hours all stands will be occupied in accordance with the demands of traffic. At all times cabs will be under the supervision and control of the telephone dispatchers and street supervisors in the district.

In other words, the two larger companies, Quaker and Yellow, are ready, with the co-operation of the commission and the city authorities, to conduct an experiment in cruising regulation within the district bounded by Arch Street on the north and Walnut Street on the south, inclusive, from the Delaware River to the Schuylkill River, these boundaries to be extended later to include the entire city as rapidly as the new method proves itself feasible and in the public interest.

New Entertainment for Toledo Children to Ride Buses

Mothers in Toledo, Ohio, are finding a new use for the feeder bus lines operated by the Community Traction Company. They give the children a nickel and put them on the bus, with a result that a child can be entertained for an hour or more by making five rides. Some children also use the bus as a pleasure vehicle by getting a dime and taking the whole neighborhood for rides. The fare for children is 1 cent.

Commissioner E. L. Graumlich reported to the board of control that the practice does not bother the company much because it is carried on mostly in off hours when travel is light. Children are provided with safe passage, are practically insured against injury and they get a good long ride for their money. Bus operators get to know them by their first names and this acquaintance feature has proved helpful in creating goodwill between drivers and patrons.

Agreement Reached on Maryland Bus Rules

New rules dealing with the operation of buses in Maryland have been agreed upon by the Maryland Public Service Commission and the operators. At a hearing on Dec. 1 all the rules but one as agreed upon at an earlier hearing were acceptable to all concerned. The one rule required the companies to make detailed reports every two weeks. These reports require so much time that the operators asked the commission to make a change.

It has been agreed that the companies keep duplicates of the daily manifests and file these every two weeks and then make detailed reports once a month. It is said that this plan was agreed to by John N. Mackall, chairman of the State Roads Commission, who wanted the reports for his department. The copies of the manifests, however, will supply him with the information he needs, it was stated, and the Public Service Commission has agreed to make this change, which met with the approval of the large number of operators who attended the hearing.

Effort to Speed Up New York Grants

Efforts are being made to speed up the hearings by the New York Transit Commission to act as quickly as possible on the applications of the Equitable Coach Company and the Tompkins Bus Company for certificates of convenience and necessity to enable them to exercise the bus franchises awarded by the Board of Estimate. The franchise granted the Tompkins Bus Company for operation on Staten Island stipulated that operation should begin within 120 days after the grant and this period will expire on Dec. 10. There is a further clause in the franchise which, in effect, grants a further period of thirty days, in which time either the board or the company may cancel the franchise.

It was said in city circles recently that the company probably would apply for an extension of the 120-day period if the commission did not grant a certificate at once. It has been discovered that through error there is a gap about a mile long in one of the Staten Island routes covered by the Tompkins Company's franchise. It was said that this route probably would have to be readvertised and approved again by the Board of Estimate.

During the week objection was registered before the commission by the Brooklyn-Manhattan Transit Corporation to the affirmation of the bus grants.

Buses May Be Operated on Another St. Louis Line

The St. Louis Public Service Company, St. Louis, Mo., plans to eliminate its Marcus Avenue railway line between Easton and Natural Bridge Avenue. If this move is made buses will be substituted for the one-man cars now in use and the line will be extended northward to connect with the Bellefontaine and Taylor Avenue car lines at West Florissant Avenue.

For the Convenience of Portland's Scholars

The Portland Electric Power Company, Portland, Ore., has extended its 39th Street bus line for a number of blocks in the Eastmoreland district to accommodate students of the new Eastmoreland school, recently opened. This gives through service to a district where previously more than one transfer was necessary from street car to bus.

Gray Line Activities Intensified

Electric railways, particularly those affiliated with the Gray Line, will be interested in the deliberations of the convention of the Gray Line, held at Banff, Alberta, Canada, during the latter part of September, 1927.

So as to foster co-operation between tourist agents and transportation, railroad and steamship companies and the Gray Line, plans were made for the co-ordination of ideals for increasing mutual benefits, with the end in view of supplying the general public with the highest type of service. Many details were discussed tending toward the betterment and development of sightseeing, to which each member contributed his part with pertinent remarks.

Diverse phases of sightseeing were taken into consideration to increase the efficiency of the service of the Gray Line, and to maintain good will all along the line. In fact, all possible avenues for the heightening of the standards of the service which the Gray Lines is organized to give were explored.

Louis Bush, president, emphasized the importance of co-operation in his report. He said, in part:

> You have in your hands probably the greatest travel institution of all times. Have you the vision to see past your own little sphere? Our future lies ahead. Remember it is by giving and doing that we succeed, and if each one will do his best for his fellow members the benefits will be greater than all that money could buy. Operating under the principle that by one all are known is rather a dangerous one unless we also adopt a further ideal of service above self.

In the secretary's report Mr. Springer enumerated the accomplishments of the past year. He advised of the wonderful growth of the Gray Line family by the addition of St. Paul, Milwaukee, Portland, Me.; Buffalo, San Diego, Norfolk, Pittsburgh, Kansas City, Ottawa, Montreal, Quebec and Minneapolis. Mr. Springer further outlined the progressive plans and ideals guiding the future development of the Gray Line, and also reviewed the results of the efforts of Mr. Dooley, traveling representative for the organization.

Officers were elected for the ensuing year as follows: Louis Bush, president, Washington, D. C.; E. B. Brown, vice-president, Los Angeles; Adrian Hughes, Jr., treasurer, Baltimore, and George E. Springer, secretary, Baltimore.

In addition to the officers, the members of the executive committee are as follows:

J. I. Brewster, Banff; S. K. Smith, Salt Lake City; J. J. Reddington, New York; H. B. Olsen, Victoria; C. C. Kunz, Chicago; B. L. Thomas, Boston; J. L. Crowley, Philadelphia, and W. A. Mulpeters, San Francisco.

The next annual convention will be held at New Orleans, La., Oct. 8-10, 1928.

Financial and Corporate

Approval Sought for $7,000,000 of Capital Improvements

Acting under the 1907 city-company agreement, the Philadelphia Rapid Transit Company, Philadelphia, Pa., on Dec. 1 requested City Council to approve the expenditure of $7,000,000 of capital funds for property betterments and retirement of securities. The request was sent to the transportation committee. It was explained that the money was to be used next year, and Ralph T. Senter, president of the P.R.T., gave details of the purposes for which the money was to be applied.

Preferred stock in the amount required is to be sold to raise the money. The largest amount is $2,750,000 for miscellaneous track improvements, extensions of lines, betterments to carhouses and substations, in compliance with the Snow report to the Public Service Commission. This work is to be done on various lines and at all of the carhouses and substations, it was said.

Retirement of bonds of underlying companies is included in the financial program for 1928. The largest amount in this part of the program proposed is $1,375,000 of car-trust certificates issued in payment of rolling stock. In addition, the financial item of the request sets forth that $92,000 of P.R.T. bonds maturing in 1957, $60,000 maturing in 1962 and $105,000 of the issue maturing in 1944 are to be retired.

There are also $20,000 of the Philadelphia & Willow Grove Railway bonds, maturing in 1934; $34,000 of Union Traction, maturing in 1952, and $25,000 of the People's Passenger Railway securities to be disposed of.

Oakland Branch Abandonment Prohibited

The California Railroad Commission denied the application of the Key System Transit Company to abandon a branch line which extends along Piedmont Avenue from the southern gate of Mountain View Cemetery to a connection with the Piedmont Avenue car line at or near the intersection of Piedmont Avenue and Mather Street, in the city of Oakland.

Dividend on Manhattan "L" Stock Deferred

The Interbourough Rapid Transit Company announced on Dec. 6 that the dividend on Manhattan Railway stock due on Jan. 1 will be deferred. Under the modified guarantee, the Interborough pays $5 a share annually as dividend rental on stock of the company from which it leases the elevated lines. A back dividend rental of $1.25 on the stock declared Sept. 1 brought payments on the stock up to date. Frank Hedley, president and general manager of the Interborough, said:

Under the terms of the Interborough-Manhattan readjustment plan of 1922, the amount of the quarterly instalment of Manhattan dividend rental due Jan. 1, 1928, is determined by earnings for the three summer months ended Sept. 30, 1927. The earnings of that period, calculated as provided for in the plan, were insufficient to warrant any payment.

For the four months to Oct. 31, the Interborough reported gross earnings of $20,917,881 and deficit of $302,805 after interest and charges.

Engineers Engaged to Survey Massachusetts Interurban

The Boston, Worcester & New York Street Railway, incorporated as a result of a drastic reorganization of the property of the Boston & Worcester Street Railway, Framingham, Mass., has engaged the Buchanan & Layng Corporation of New York to make a complete survey of the situation and take charge of the operating management of the company. C. B. Buchanan, the president, is now in Framingham and will spend three or four months in a personal study of all angles of the situation affecting both passenger and freight service and motor coach operation.

Holding Company for St. Louis and Kansas City Stock

A company to hold common stock of the electric railways of St. Louis and Kansas City, known as the City Utilities Company, has been organized under the laws of Delaware by J. K. Newman and others interested in the St. Louis and Kansas City railway systems. Mr. Newman has been elected president of the new company and Col. A. T. Perkins, who was manager of the United Railways under Receiver Rolla Wells, has been named vice-president.

The City Utilities Company was formed to expedite the work of looking after the affairs of the new interests in St. Louis and Kansas City. The extent of its holdings has not been made public.

Mr. Newman was one of the chief figures in the reorganization of both the St. Louis and the Kansas City railway properties.

Stock of the Kansas City Public Service Company is held in trust for five years by five trustees, W. S. McLucas, William G. Woolfolk, George W. Davison, J. K. Newman and Powell Groner. This was accomplished under the reorganization plan. Beginning in April voting trust certificates were issued to the owners of the old holdings of the railway.

Traffic, Fare and Wage Figures

Electric railway traffic continued to decline during the month of October compared with the similar month of the previous year. The number of revenue passengers, including bus passengers, reported to the American Electric Railway Association by 198 companies for October, 1927, compared with October, 1926, is as follows:

October, 1927	785,250,909
October, 1926	801,672,805
Decrease, per cent	2.05

The average cash fare in cities of 25,000 population and over:

	Cents
November 1, 1927	7.9846
October 1, 1927	7.9516
November 1, 1926	7.7570

Average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track:

	Average Hourly Rate Cents	Index Number 1913 = 100 Per Cent
November 1, 1927	57.27	210.17
October 1, 1927	57.26	210.13
November 1, 1926	56.88	208.73

$18,000,000 Refunding Issue at Minneapolis

An issue of $18,000,000 in refunding bonds of the Twin City Rapid Transit Company, Minneapolis, Minn., to be used for refunding the bonded debt of both the St. Paul City Railway and the Minneapolis Street Railway is planned by the company. The purpose of the company, according to a statement by Mr. Lowry, is to make possible refunding of all existing debt as it matures, and to provide complete separation of the bonded debt of the two companies. The companies operate independently under state regulation.

A statement issued in anticipation of the issue being advertised for sale to the public by the bankers said:

The first and refunding 5½ per cent mortgage bonds of the Minneapolis company and the refunding 5½ per cent mortgage bonds of the St. Paul company are to be pledged as collateral security, dollar for dollar, for an issue of first lien and refunding 5½ per cent bonds of the Twin Cities Rapid Transit Company.

This will enable the operating companies to refund their present bonded indebtedness as the same matures, at a cost much less than if each company were financed independently. It also provides a complete separation of the bonded indebtedness of the two companies and the cost of the money will be the same in each city.

There will be issued at this time $18,000,000 of first liens and refunding 5½ per cent gold bonds of the Twin City Rapid Transit Company. This issue of bonds has been sold to a syndicate of bankers headed by the Federal Securities Corporation, including the Chase Securities Corporation, New York; H. M. Byllesby & Company, Inc., and Halsey, Stuart & Company, Inc. It is expected this banking syndicate will make a public offering of the securities at an early date.

A petition filed with the state regulatory body stated that the bonds will

Digitized by Google

mature in 25 years. A total of $12,037,000 will be pledged by the Minneapolis company with $5,963,000 allocated to the St. Paul company.

Public offerings of the $18,000,000 Twin City issue was made on Dec. 7 at a price of 97 and interest to yield more than 5.70 per cent.

Revenue and Traffic Fall Off in Honolulu

The total revenue from all sources for the year 1926 of the Honolulu Rapid Transit Company, Honolulu, Hawaii, was $1,023,772, compared with $1,074,483 for the year 1925. Total operating expenses for the year were $662,932, compared to $708,716 for the year 1925, in addition to which the sum of $13,939 was charged to operating expenses for replacements during the year, compared with $26,283 for replacements during 1925. These facts were contained in the manager's report, a part of the annual statement.

The number of passengers carried during the year 1926, compared with 1925, is here shown:

Rail:	1926	1925
Full fares and half fares	16,286,105	17,071,473
Free fares	92,081	169,929
Total	16,378,186	17,241,402
Transfer passengers carried	3,357,651	3,499,425
Kalihi Bus Operations:	1926	1925
Full fares and half fares	347,287	351,044
Free fares	1,108	1,686
Total	348,395	352,730
Transfer passengers carried	315,165	305,923
Bus miles operated	128,441.30	130,596.70

The segregation of transportation revenue and operating expenses is here shown, comparing the years 1926 and 1925;

Revenue:	1926	1925
Passenger revenue	$992,063	$1,040,452
Bus revenue	21,536	21,081
Special car revenue	1,265	1,254
Freight revenue	242	.....
	$1,015,107	$1,062,788
Operating Expenses:	1926	1925
Way and structures	$55,204	$63,111
Equipment	74,127	76,797
Power	94,179	104,868
Conducting transportation	322,356	346,578
Traffic	2,252	5,926
General and miscellaneous	114,811	111,435
	$662,932	$708,716

Power was taken from the Hawaiian Electric Company during the months June to October, both inclusive, and the three-year contract was terminated as of Dec. 1. The company is now operating its own power plant without a stand-by contract, but with the assurance that power will be furnished in case of emergency at the contract rates pending negotiations for a new contract.

Expenditures on upkeep of track and equipment were kept as low as possible consistent with the general program of economy.

The capital expenditures program for the past year amounted to $28,333.

The report states that the group life insurance has proved its value in the assistance provided for the families of several employees who died since the insurance has been in effect. The employees' relief fund, which is handled by the employees' council, is being drawn upon in many cases of real need and is proving a benefit which is well worth while.

President Castle's report to the stockholders refers, among other things, to the Sachse survey and recommendations.

REVENUE ACCOUNT OF HONOLULU RAPID TRANSIT COMPANY, LTD., FOR YEAR ENDED DEC. 31, 1926

Revenue from transportation		$1,015,107
Operating expenses		662,932
Net revenue from transportation		$352,175
Revenue from other railway operations		8,664
Net revenue from railway operations		$360,840
Taxes—		
Property	$83,188	
Income	9,672	
Capital stock	1,030	
Corporation income	25,924	
Public utilities	2,074	
Vehicle licenses	739	
Bus licenses	50	122,678
Gross revenue, less operating expenses and taxes		$238,161
Depreciation	$46,607	
Replacements chargeable to operating expenses	13,939	
Loss on property retired	3,097	63,644
Net revenue 1926		$174,517
Interest on loans	$6,318	
Dividends	150,000	156,318
Balance net revenue 1926 to surplus		$18,198
Surplus:		
Balance as at Jan. 1, 1926	$266,406	
Less, additional corporation income tax, 1924	4,689	261,716
Balance carried to 1927		$279,914

Situation in Oklahoma City Declared Promising

The Oklahoma Railway, Oklahoma City, Okla., has been placed on a paying basis under the federal receivership, according to figures made public by G. T. Lackey, one of the receivers. Net earnings of the company from Jan. 1 to October of this year were $89,571, after all expenses and depreciation were provided. During October the net earnings were $14,188, compared with $8,114 for September. A large amount was spent for repair work and new material in September.

Purchase of California Line Sanctioned by I. C. C.

Plans of the trunk line railroads for acquiring the Central California Traction Company were finally approved on Dec. 5 by the Interstate Commerce Commission.

The Southern Pacific, Western Pacific and Santa Fe will jointly take over the electric railway under the arrangement approved, paying for it $2,650,000.

Under the terms of the original proposal, the Southern Pacific alone would have acquired the electric system, but the commission required it to share ownership.

The railroads concerned already have completed their financing arrangements for the purchase.

Smaller Preferred Dividend in Denver

The directors of the Denver Tramway Corporation, Denver, Col., have declared a quarterly dividend of three-quarters of 1 per cent on the preferred stock payable on Jan. 1 to holders of record Dec. 15. From October, 1925, to October, 1927, inclusive, the company paid quarterly dividends of 1¼ per cent on this issue. The preferred stock is preferred as to dividends up to 7 per cent per annum, of which the first 5 per cent is cumulative, whether earned or not, and the remaining 2 per cent cumulative only when earned in any year, but not paid.

New Directors in St. Louis

The new directors of the St. Louis Public Service Company, successor to the United Railways, are as follows: Louis P. Aloe, president A. S. Aloe Company; A. T. Perkins, vice-president City Utilities Company; Mark C. Steinberg, president Mark C. Steinberg & Company; Stanley Clarke, vice-president St. Louis Public Service Company; A. C. F. Meyer, president Lafayette-South Side Bank; J. K. Newman, president Newman, Saunders & Company, Inc., New York and New Orleans; Henry S. Priest, Boyle & Priest; A. L. Shapleigh, president Shapleigh Hardware Company, St. Louis; J. Sheppard Smith, president Mississippi Valley Trust Company; Walter W. Smith, vice-president First National Bank in St. Louis; F. O. Watts, president First National Bank in St. Louis; George W. Wilson, president Mercantile Trust Company, and Hugo Wurdack, president Wurdack Securities Company.

OPERATING STATEMENT OF THE HONOLULU RAPID TRANSIT COMPANY, LTD.

Book Reviews

The Claim Agent and His Work

By Smith R. Brittingham, LL.B., assistant general solicitor Seaboard Air Line Railway. New York: The Ronald Press Company. 466 pages. Price $6.

There are too few books on the important subject of claim adjustments. Their place is not taken by treatises on the law of negligence, written primarily for lawyers, although they also form a necessary adjunct to the library of the claims man. The book under review, by an author who understands the problems met in railroad claims work, while primarily directed to the steam railroad claims man, has also practically as direct application to the electric railway field.

The first half of the book is devoted in large part to a general review of the salient principles of the law of accident liability. There are chapters, for instance, on the passenger, employee under the common law, employee under the federal employers' liability act, licensees and trespassers, invitees or guests, and workmen's compensation. In the latter part of the book, where the scope and principles of claims adjustment are more directly considered, the topics discussed include: Principles of investigation, releases, statistical methods in claim agency, psychology and claim agency, medical phases of claim agency, some problems of the claim agency, and forms. Besides these, there are tables of the expectation of life in years, life annuities, etc., and the appendices include glossaries of medical and legal terms.

The book should help the claim agent over many a difficult problem. It should also, if read by the operating railway manager, indicate to him clearly, if he does not already realize that fact, the extent of the responsibilities of the claim agent and the importance of the work of the claims department.

Beyond the Counter

Mary B. Reeves, manager industrial and school savings the Philadelphia Saving Fund Society, Philadelphia, Pa., 1927. 86 pages. Price $1.90.

Assuming that the welfare of the worker is an important factor in the growth of an industry and the development of a community, a necessary requirement is enlightenment within the ranks concerning the workers' responsibilities as potential capitalists. Thus does labor become stabilized and capital and labor mutually supplementary. There must be a service to help investors, in the opinion of Mary B. Reeves, who has studied banking methods in this country and abroad as a free lance. She has a message for every employer and employee. The employee by this time knows that systematic saving is insurance against anxiety, business reverses and desolate declining years.

At some length Miss Reeves discusses the need for industrial saving from the viewpoint of the employer and gives in detail the two main classifications, namely, the payroll deduction plan and the voluntary association plan. It is her belief that the idea of industrial saving is as yet new to the majority of employers. After years of working in this field she sees in industrial savings a means to reduce labor turnover, to improve the workers' morale and to lessen radical tendencies within the ranks. She is unsympathetic with the notion that employees resent this intrusion into their personal affairs. Rather do they welcome it if the advertising appeal is made with a knowledge of human psychology and from the viewpoint of the worker.

Now that many utility employees throughout the country have had the opportunity to become part owners of an enterprise by subscribing to company stock for their future welfare, Miss Reeves' argument, differently presented for consistent thrift practices and wise expenditures, will meet with their ready indorsement. Her plan means education, to the end that $1,000,000,000 shall not be thrown away annually in speculation.

The Art of Speculation

By Philip L. Carret. Boston, Mass.: Barron's, the National Financial Weekly. 365 pages. Price, $3.

To some persons the title "The Art of Speculation" would seem to have a sinister sound. But the title must be accepted in its broader sense. The need does not exist to go into a discussion of relative values, but it would seem that the reader should be reminded that every one who invests is really a speculator. There is a certain inescapable risk in the ownership of even the highest grade securities. But this review is not intended to be either a defense of the title of the present book or of its contents.

One thing is certain. There is much of interest in the book, particularly for those engaged in various phases of public utility work. Of course, the contents are intended primarly for the market operator, but the chapters that tell the reader how to analyze an annual report correctly, how and when to buy bonds and stocks, carry by their implications a message to officials intrusted with the conduct of the fiscal policies of the corporations for which they act. Of the electric railways in general the author has comparatively little to say, but he concludes his consideration of them with this paragraph:

> Cut-throat competition of bus lines among themselves and with the interurbans will eventually be ended by financial exhaustion of the weaker participants and by legislative and court action to insure safe and adequate public service. When that day comes a real bull market in traction securities is by no means inconceivable.

The prospects of receivership are not pleasant to contemplate, but there is much food for thought in the chapter "Profits in Financial Surgery." Mr. Carret has so handled his subject as to make the book very readable.

Bibliography on Management

Prepared under the direction of the executive committee of the A.S.M.E., Management Division, New York, N. Y. Price $1.65.

This work represents important material published on management. The more than 2,000 references to be found within its pages will show the valuable literature appearing in American and Canadian periodicals and in a great number of books published in England and in Great Britain the past 25 years.

N.E.M.A. Handbook of Supply Standards

New York, N. Y.: National Electrical Manufacturers Association. 231 pages. Price, $3.50.

This completely revised edition of the N.E.M.A. Handbook of Supply Standards is indexed and illustrated and contains standards indorsed by 189 manufacturers, with approximately 125 illustrations, diagrams of designs and methods and numerous tables and curves. These standards have been approved by the standards committee, the official body for the control of technical standardization within the association. "This handbook represents in printed form the experience and knowledge of practical and technical men, who have for years been most vitally concerned with the design, manufacture and installation of electrical supply equipment," says C. A. Bates, chairman of the standards committee.

Alternating-Current Rectification

By L. B. W. Jolley, M.A., General Electric Company, Ltd., London, England. New York, N. Y.: John Wiley & Sons, Inc. 472 pages. Price, $6.

Unidirectional currents have large possibilities both in the supply of power and in the laboratory, yet in no branch of electrical engineering has development been so retarded as in that of rectification. Mr. Jolley has prepared the second edition of his book, "Alternating Current Rectification," noting new improvements and revising the contents thoroughly.

In this treatise the author describes clearly the methods for rectification available and presents the mathematical analysis with numerical examples whenever such are possible. The book covers wave form, mechanical rectifiers, gaseous conduction, liquid conduction, wireless rectifiers and alternating current measurements and voltage regulations. Thermionic rectifiers have received particular attention.

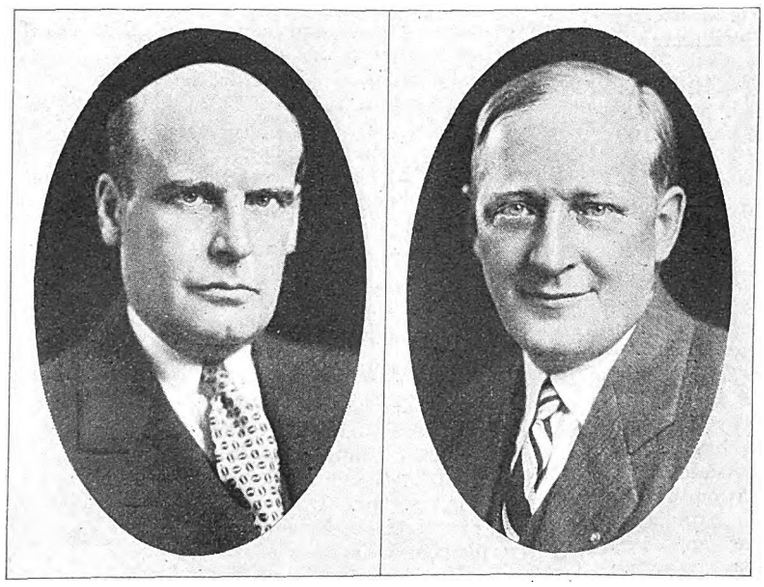
Personal Items

New Management Takes Hold in St. Louis

OFFICERS of the St. Louis Public Service Company, which started operation of the properties of the United Railways at midnight on Nov. 30, include the following: A. L. Shapleigh, president; Stanley Clarke, executive vice-president and counsel; Sam W. Greenland, vice-president and general manager, and Thomas E. Francis, general attorney.

Mr. Shapleigh's position as president of the newly organized properties will be primarily a supervisory one as it was with the United Railways when he served in a similar capacity. He is an important business factor in the West and an officer of the Shapleigh Hardware Company. In commenting on his new position President Shapleigh said that in accepting the post of president he felt that he and his associates, directors and officers of the company, were aware of their responsibility to the public, which it would be their aim to discharge in full. He considered that the general public of the community, as well as the company, owes much to the manner in which the railway properties were maintained during the receivership, just ended, under the leadership of Rolla Wells, as receiver, and Col. Albert T. Perkins, as his manager. With hopes for co-operation on the part of the city and the general public, the aim would be to maintain good service, and from time to time to introduce certain changes in the line of improvements.



Stanley Clarke Sam W. Greenland

Stanley Clarke, who will be in immediate control of the company as counsel and executive vice-president, was counsel for the reorganization committee representing the old security holders. Before going to St. Louis he was prominent in New York, where he was in general law practice.

Sam W. Greenland, the new vice-president and general manager, will have a task ahead of him as important as he had when he went to St. Louis in 1924 to assist in the work in connection with the reorganization of the United Railways. In assuming the rôle of ameliorator at St. Louis he resigned his position as vice-president and general manager of the Indiana Service Corporation, Fort Wayne, Ind., and as general manager of the Fort Wayne & Decatur Traction Company and the Fort Wayne, Van Wert & Lima Traction Company.

Mr. Greenland has a knowledge of public utility problems covering a period of nearly 30 years. In the Middle West he stands for progress both in modernizing and merchandising railway transportation. A notable example of his genius in these respects was his deft handling of the Fort Wayne properties, where an important part of his work was the recasting of the financial structure of the Fort Wayne & Northern Indiana Traction Company and the organization of its successor, the Indiana Service Corporation.

Mr. Greenland was born at Clarion, Pa., in 1879. He was educated at the Pennsylvania Military College, Chester, Pa., and at Penn State University. From the time of his first utility job with the Bell Telephone Company at the turn of the century up through his various connections, both in operating and association activities, until he became identified with the Fort Wayne properties in 1911 and later the St. Louis properties, is a long recital of pushing ahead, winning the confidence of his public and doing big things. The details of this career were included in an extended biography published in the ELECTRIC RAILWAY JOURNAL, issue of April 19, 1924.

Thomas E. Francis, who will act as general attorney for the St. Louis Public Service Company, served as general attorney for the receiver of the United Railways. He estimates that all of the legal work on hand can be disposed of in a month or six weeks from Dec. 1, and then with the acceptance of the report of the receiver the St. Louis Public Service Company will be free to operate the St. Louis railway system as a private corporation still subject to the state law.

With the enthusiasm attending the ushering in of the new régime the untiring efforts of the Wells-Perkins combination in the reorganization details were not overshadowed. St. Louis newspapers unanimously complimented Receiver Wells on the manner in which he filled an important job since 1919. His farewell message to the officials and employees thanked them for their loyalty to him and the company, their support of the rules and policies, their efficiency in service and co-operation for its success. Mr. Wells leaves his post very little changed in appearance with the passing years and he still retains that freshness of outlook and keen analytical vision that made him a civic, financial and political leader of the community. The son of the original promoter of the old Missouri Railroad, Rolla, at the age of 22, was serving as manager of this system. That chapter covering the years 1878-1883 was an important one in the career of the man who was to serve two terms as Mayor of St. Louis and become a leading figure in business and banking circles.

The commendatory comments on Mr. Wells' success are shared by Col. A. T. Perkins, who served as general manager under the former's receivership and helped to make the partnership of Wells and Perkins an important one in transportation affairs in that city. Mr. Perkins, who retains a place on the board of directors, was an executive officer and engineer of various railways and adviser on terminal matters in many cities and served as manager for the receiver in St. Louis since 1919. He began his business career as a clerk in the service of the Chicago, Burlington & Quincy Railroad in Chicago in 1887. Colonel Perkins' announcement of his retirement from the office of general manager for the receiver effective Nov. 30, coincident with the retirement of Mr. Wells, was made by him personally in an address to an audience of employees at the Park Avenue station on Nov. 25.

Receiver Wells filed an affidavit with the Missouri Public Service Commis-

Digitized by Google

sion at Jefferson City on Nov. 30 that he had complied with all terms of the federal court in the sale and transfer of the properties to the St. Louis Public Service Company. An affidavit was also filed by Walter Dew Bradley, secretary of the reorganization committee, setting forth that all details of the organization had been carried out and that the transfer of the properties would be consummated at midnight on Nov. 30. These filings were mere formalities to perfect the records in the office of the state commission and will be followed by a formal order of the commission transferring the rate schedules of the United Railways and its subsidiaries to the new owners.

L. E. Lippitt Leaves Railway Field

L. E. Lippitt, general manager of the Auburn & Syracuse Electric Railroad, Auburn, N. Y., and former president of the American Electric Railway Accountants Association, has tendered his resignation to T. C. Cherry, president of the company, to take effect on Jan. 1, 1928. He will become associated with the Thermo-Ice Corporation, one of Auburn's new enterprises which manufactures and sells ice refrigerating machines.

Mr. Lippitt is one of the youngest electric railway executives in central New York State. His career began with the Oneida Construction Company, which electrified the West Shore Railroad between Syracuse and Utica. This line is now operated by the New York State Railways. He entered the employ of the New York State Railways in 1907, serving in various subdivisions of the accounting department.

Six years later he was appointed auditor of the Syracuse & Suburban Railroad and three years later became auditor-treasurer of the Auburn & Syracuse Electric Railroad under the management of Peck, Shannahan & Cherry, Inc. Mr. Lippitt was promoted to general manager on July 1, 1926, to succeed W. J. Harvie, resigned.

Mr. Cherry will take over the active management of the railroad as president and general manager on Jan. 1, 1928.

C. E. Smith Goes with New Haven Road

Charles E. Smith, consulting engineer of the city of St. Louis, who last September completed an exhaustive survey of the New York City transit situation for the Comptroller, has been appointed a vice-president of the New York, New Haven & Hartford Railroad. His duties will be to assist President Edward J. Pearson in problems relating to improvements, construction, operation and other matters. Mr. Smith's immediate responsibility, according to New Haven officials, will relate to the development of plans for meeting increasing traffic requirements, for better service to shippers and passengers, and for making such improvements as revenues and credits will permit.

Mr. Smith was born in Somerville, Mass., in 1877. He graduated from the Somerville High School in 1895 and the Massachusetts Institute of Technology in 1900.

The first engineering work done by Mr. Smith was in the summer of 1897, on the New York & New England Railroad, now part of the New Haven System, at and around Boston, and later largely on municipal and county road improvements, during the years 1898-1900. During the years 1900-1903 he was engaged in the bridge engineering department of the New York, New Haven & Hartford Railroad, with which, and its problems, he is already largely acquainted.

During the years 1907-1915 he was employed by the Missouri Pacific Railroad with headquarters at St. Louis for several years as chief engineer in charge of maintenance and construction. Subsequently, under the firm name of C. E. Smith & Company, he has been a consulting adviser to numerous railroads, city administrations, public utilities, industrial companies and for the last 12½ years as consulting engineer and technical adviser to the city administrations of St. Louis on railroad and public utilities matters.

Promotions in Byllesby Personnel

William H. Hodge, vice-president and manager sales and advertising department, Byllesby Engineering & Management Corporation, announces the appointment of J. W. Devereaux as manager merchandise division, T. P. Pfeiffer, manager advertising division; J. F. Gardiner, manager financial advertising, and J. W. Hicks, editor Byllesby publications.

Mr. Devereaux will supervise merchandising activities at all properties under the direction of Byllesby Engineering & Management Corporation. He has been connected with the operating department of the Byllesby organization for the past sixteen years.

Mr. Pfeiffer will supervise the advertising of the Byllesby Engineering & Management Corporation and the companies operating under its direction. He has been in the advertising department since 1922, and prior to that time was with the Louisville Gas & Electric Company for eight years.

Mr. Gardiner will be in charge of financial advertising for H. M. Byllesby & Company. He has been a member of the advertising department since 1922. For eight years previous he was an editor or financial writer for a number of the leading newspapers of the Middle West.

Mr. Hicks has been managing editor of *Byllesby Management* for the last two years. He also will edit the *Byllesby News Bulletin* and *Byllesby Monthly News*. For ten years prior to 1925, when he joined the Byllesby organization, he was engaged in newspaper work in the Middle West and on the Pacific Coast.

Alex Dow Heads Mechanical Engineers

Alex Dow, president of the Detroit Edison Company, Detroit, Mich., will succeed Charles M. Schwab, chairman of the Bethlehem Steel Corporation, as president of the American Society of Mechanical Engineers. Mr. Schwab retires after one year of service. Mr. Dow, prominent in the engineering world, a native Scotsman, who in 1895 became a citizen of the United States, has been a member of the society since his naturalization. He has been connected with the Baltimore & Ohio Railroad, the Brush Electric Company and other companies.

Charles G. Adsit Resigns from Atlanta Property

Charles G. Adsit, nationally known engineer, has resigned as vice-president of the Georgia Power Company, Atlanta, Ga., to enter private business. Mr. Adsit has been long identified with the Atlanta properties. He was made executive engineer on April 1, 1922, with authority and jurisdiction over engineering work of all departments and in May of the same year he assumed the rôle of vice-president.

Prior to his affiliation with the companies operating in Atlanta, he had extensive engineering experience in the western part of the United States, South America and Mexico. He was elected a director of the Chicago & West Towns Railway, Oak Park, Ill., early in the current year.

OBITUARY

FRANK J. GATRELL, superintendent of the department of accident investigation of the Chicago Surface Lines and one of the oldest officials in point of service, died at St. Francis Hospital, Chicago, on Dec. 4, after a short illness. He began his service with the claim department of the Surface Lines in 1894 as junior clerk and rose from that position to chief adjuster, general claim agent and finally superintendent of the department. He had a national reputation among claim agents and insurance companies.

PATRICK J. BOYLE, transportation superintendent of the Community Traction Company, Toledo, Ohio, died on Saturday, Nov. 19. He entered the service of the railway at Toledo 37 years ago as a driver of a horse car and later became a motorman when electric power was applied to the lines. His long experience made him unusually familiar with the property in Toledo and one of the most valuable members of the executive staff. The phrase "Call Pat Boyle" became the order of the day as a way out of most any kind of difficulty. Mr. Boyle was born in Ireland 67 years ago.

Manufactures and the Markets

I.R.T. Needs 107 New Cars Now, Says Colonel Lancaster

At a hearing of the New York Transit Commission on Dec. 5 Col. William C. Lancaster, chief engineer of the commission, testified that 107 new cars were needed immediately by the Interborough Rapid Transit Company and gave as his opinion that 400 new cars would be needed by the company to meet its service requirements during the next two or three years.

Arthur G. Peacock, of counsel for the company, reserved the right to cross-examine Colonel Lancaster. Commissioner Lockwood of the Transit Commission put the matter over for two days.

Distribution of the 107 new cars was suggested by Colonel Lancaster as follows: White Plains Avenue line 40; Pelham Bay Park line, 30; Astoria line, twelve; Lexington-Fourth Avenue line, ten; Corona extension, six, and nine to be held in reserve.

Montreal Tramways Officials Inspect New Cars

Inspection of Montreal's newest type of street cars took place recently when the first of the 50 cars ordered last summer from the Canadian Car & Foundry Company by the Montreal Tramways, Montreal, Canada, were delivered. The order for these cars was forecast in the JOURNAL for Feb. 19, 26 and March 12 and the placing of it in the issue of Sept. 3.

Among those included in the inspection party were Julian C. Smith, president, and Col. J. E. Hutcheson, vice-president and general manager of the Montreal Tramways, and other officers of the company, as well as J. F. Saint-Cyr, chairman of the Montreal Tramways Commission, and Gustave Comte, secretary.

Of the two-man type, the cars have a seating capacity of 44 passengers and are 5 ft. longer than the one-man cars constructed last year. The space between the front facing seats at the head of the car is wider than in previous designs and there is a better arrangement of the motorman's section. This provides more space for passengers.

Some of the new features are that the cords running along the inside of present cars are dispensed with and the signal for the motorman to start is given electrically when the rear door is closed by the conductor. Should the motorman wish to signal the conductor a bell and push-button arrangement is provided. Aluminum rails run along the sides of the car instead of individual hand straps. Safety devices are one of the prominent features of the new cars.

The eighteen buses ordered some time ago cost from $14,000 to $18,000 each. Three of the new buses are of the "street car on rubber" Versare type. The operation is combined gas and electricity and the front of the bus is like the front of a street car with the motor and other equipment in the rear. The other fifteen buses are the regular four-wheel type, similar to those used on Sherbrooke Street.

Steel Tops for Some P.R.T. Buses

Philadelphia Rapid Transit Company, Philadelphia, Pa., it is reported, announced this week that all Penn-Jersey double-deck buses will shortly be equipped with steel tops over the upper open section. There is a possibility that double-deck buses on local lines eventually may be similarly equipped. The new inclosures allow more than 5 ft. headroom on the top deck. The sides of the new covers are equipped with ventilators.

General Prosperity Shown by Hoover's Report

EVERY previous record of volume of production and consumption in the United States and in the physical quantity of exports and imports was broken, according to the annual report of Secretary of Commerce Herbert Hoover. This report, released on Dec. 2, embodies interesting facts on the economic progress of the country in the fiscal year ended June 30.

There was very little unemployment, except during a moderate recession near the end of the year, and the rate of real wages remained higher than anywhere else in the world, or than at any other time in the world's history. The high prosperity of the year did not represent merely an upward swing in the business cycle, but was the result of that general and permanent progress the extent and causes of which are more fully set forth in the various sections of the report. There were a few aspects of American business which were less satisfactory, some of which were noticeable in the coal and textile industries, the relatively low price of cotton with its depressing effect upon the farmers of large regions of the South, and some continued depression in agriculture of the Mid-West.

The volume of output in the manufacturing industries, by all odds the largest branch of productive activity, showed an appreciable gain even above the exfremely high level of the fiscal year 1925-1926. The most conspicuous gains shown, as compared with 1925-1926, are in mineral production, freight transportation, output of electric current, and sales of 5 and 10-cent stores. Electric current is being used in rapidly increasing quantities for lighting, for domestic power and heat, and above all for industrial power.

In the discussion of agriculture the situation of the farmer has an important bearing on the general trend of industry and commerce, according to the report. The crops harvested in the autumn of 1926, constituting the main factor in the agricultural situation of the fiscal year, were in the aggregate the largest produced in our history with the exceptions of the years 1915 and 1920.

The report states that the building and construction industries played a great part in the prosperity of the fiscal year. New construction undertaken in the fiscal year 1926-1927, amounting to some seven billion dollars in value, constituted a powerful factor in maintaining general business activity and prosperity.

Railway Efficiency Commented On

During the last two fiscal years a conspicuous increase has occurred in the volume of railroad freight traffic even as compared with the high figures for the fiscal years 1924 and 1925. The ton-mileage of freight in 1925-1926 was about 8 per cent greater than the year before, and 1926-1927 showed a further increase of about 5½ per cent. This gain in traffic was accomplished with an insignificant addition to the number of employees, a fact indicating the continued advance in the efficiency of the railways which has been going on since the close of the war.

Concerning motor transport it is brought out that the rapid increase in the use of motor trucks and motor buses in conjunction with older forms of transport has been remarkable, and this increase reflects to a large degree the rapidly changing conditions in modern methods of transportation and the progress made in highway surfacing. Sixty steam railroads have 1,253 buses in operation, covering 11,440 route-miles, while there are 19,099 buses operated in competition with railroads, the route mileage being 334,522. Electric railroads in 1927 were using 7,284 buses compared with 5,150 the previous year, common-carrier bus route mileage in-

Be?

The committee having this in charge will tell us on Dec. 16.

Digitized by Google

creased from 232,340 in 1926 to 270,068 miles this year. The total number of buses in operation increased from 69,425 to 80,040 during the year.

The financial markets are but briefly touched on in this report. From the banking point of view, the fiscal year, like the calendar year, was one of sound but uneventful growth with ample money at low and stable rates.

Foreign trade, which is one of the principal phases of the Commerce Department, shows a very encouraging growth. The value of exports during the fiscal year 1926-1927 was greater than in any other fiscal year since 1920-1921, and when account is taken of the much lower price level, as compared with the war years, this past year was the greatest in our history.

There has been an extraordinary increase in the production of American industry during recent years with a consequent corresponding advance in the standards of living. This reflects not merely recovery from the dislocation caused by the war, nor from the low point of the post-war slump—it represents in large part an advance beyond the highest pre-war levels and marks a trend which we may well consider of a permanent character.

The basic causes of economic progress translate themselves into a number of more specific and directly working causes. Among these may be mentioned especially the advance in education, scientific research and invention; the growing use of mechanical power, machinery, and other forms of capital; the larger scale of production; the conscious and concerted effort to eliminate waste and reduce costs; the high scale of wages, with consequent general high buying power; and the relative stability of prices, money and credit.

In compliance with the new responsibilities assigned to the Department of Commerce by the passage of the air commerce act of 1926, providing for the promotion and regulation of civil aeronautics, the department's first task was to organize aeronautical activities and select the necessary personnel. These activities were assigned to five divisions, under the Director of Aeronautics and Assistant Secretary of Commerce provided for in the new act.

Copper Makes Further Advance

THE feature of the non-ferrous metal markets during the week ended Dec. 7 was the further advance in price of copper, accompanied by active business for both domestic and foreign accounts. Lead has also sold in excellent volume at somewhat higher prices. Tin has been firm and quiet. The one dull spot has been in zinc, sales being small and prices virtually unchanged.

Copper advanced nearly ½ cent per pound during the week ended Dec. 7. Three advances during the week seem only to have whetted the appetite of foreign buyers, and domestic consumers have felt forced to join the buying movement with the best grace they can muster. The successive advances in the c.i.f. price were as follows: on Dec. 2 from 14.05 cents to 14.25 cents, on Dec. 5 to 14.35 cents, and on Dec. 7 to 14.50 cents. The advances in the domestic market were made sooner by some sellers than others, which accounts for the range in prices for the individual days. Some metal was to be had the morning of Dec. 7 at 14.075 cents, delivered in Connecticut, but in the afternoon this seemed to have disappeared and some producers advanced their price to 14.25 cents.

Though lead prices underwent a sharp advance Dec. 1, there was no let-up in buying; in fact, demand for the next two or three days after the increase was made was better than it had been before. On that day, Dec. 1, the American Smelting & Refining Company advanced its contract price from 6.40 to 6.50 cents, New York, and the principal seller in the Middle West went to 6.325 cents, St. Louis, which was subsequently raised to 6.34 cents. The advance in London culminated on Monday, and with the lower quotations cabled from abroad Dec. 6 and 7 there was less insistent demand on this side.

In spite of the absence of any considerable demand, prices for zinc have remained steady. High-grade is still quoted at 7.75 cents New York, on a purely nominal basis.

Trading in tin has been moderate, with most of the interest on the part of the dealers. Prompt quotations apply also to December and January, later deliveries being about ⅛ cent less. Prices have averaged about the same as last week—about 59 cents for Straits.

Malleable Iron Fittings Company Acquires Bridgeport Concern

The Malleable Iron Fittings Company, Branford, Conn., has acquired the Clark-Williams Engineering Company, Bridgeport, Conn. The Bridgeport concern has manufactured and marketed pole mounts for application to telegraph, telephone and power transmission lines. The patented device comprises two heavy malleable iron castings which clamp the butt of the pole to a concrete base embedded in the ground. Rolland G. Williams, the inventor of the device, has joined the staff of the Malleable Iron Fittings Company, and the office of the Clark-Williams Engineering Company has been moved to Branford, Conn.

Twelve One-Man Cars for Knoxville Power & Light

Specifications have recently been released for twelve one-man, passenger, city type, single-end, double-truck cars which were ordered in November by the Knoxville Power & Light Company, Knoxville, Tenn., from the Cincinnati Car Company, Winton Place, Ohio. Mention that the cars would be ordered was made in the JOURNAL Nov. 5.

The units will have an over-all length of 43 ft. 9 in., total weight of approximately 30,000 lb., a seating capacity for 54 passengers and will be of semi-steel construction. The exterior color scheme will be yellow and cream and the interior trim cherry. Haskelite headlining has been specified, as have General Electric No. 264 motors.

Subjoined are the specifications as released by F. V. Underwood, general manager of the Knoxville Company:

Number of units	12
Type of unit	One man, motor, passenger, city, single end, double truck
Number of seats	54
Builder of car body	Cincinnati Car Company, Winton Place, Ohio
Date of order	Nov. 21, 1927
Date of delivery	Four months
Weight, total	Approximately 30,000 lb.
Bolster centers	24 ft. 0 in.
Length over all	43 ft. 9 in.
Length over body posts	33 ft. 6 in.
Truck wheelbase	5 ft. 0 in.
Width over all	8 ft. 6 in.
Height, rail to trolley base	10 ft. 5½ in.
Window post spacing	30 in.
Body	Semi-steel
Roof	Arch
Air brakes	Westinghouse
Armature bearings	Plain
Axles	3¼ in. diameter
Car signal system	Faraday high voltage
Compressors	Westinghouse DH-16
Conduit	Duraduct
Control	General Electric
Curtain material	Pantasote, double-faced morocco
Destination signs	Keystone illuminated
Door mechanism	National Pneumatic Co.
Doors	End, folding, C-2320
Fare boxes	Cleveland
Finish	Old Dutch enamel
Floor covering	Battleship linoleum
Gears and pinions	13-74 ratio
Glass	Double strength American, set in felt
Hand brakes	Drop handles
Hand straps	White enameled metal
Heat insulating material	Cork and asbestos
Heaters	Consolidated Car Heating Co.
Headlights	Golden Glow, type RM-96
Headlining	Haskelite, ivory color
Interior trim	Cherry
Journal bearings	Plain
Journal boxes	3-in. x 6-in.
Lamp fixtures	Flush type
Motors	GE-264
Painting scheme	Yellow and cream
Roof material	Haskelite
Safety car devices	Safety Car Devices Company
Seats	Hale & Kilburn, 17 in. x 36 in.
Seat spacing	30 in.
Seating material	Green plush
Slack adjusters	Brill
Steps	Folding, 9½ in. x 36 in. treads
Trolley catchers	Ohio Brass
Trolley base	Nuttall U.S.-13-E No. 1224
Trolley wheels	5 in. with V. & K. harp
Trucks	Brill, 76-E1-x
Ventilators	Ten, Nichols-Lintern, type C
Wheels	Steel, 26-in. diameter
Wheelguards	H-B
Special devices	Treadle doors and steps and brake interlocking devices

What Is a Modern Car?

REQUIREMENTS of the modern car have been discussed at length so often that it would seem there is nothing more to be said. Still, despite all the publicity that has been given to the subject doubt seems to exist in the minds of some railway men as to just what constitutes a modern car. For instance, the manager of a property recently approached his banker with a request for funds with which to purchase some modern cars for his road. The banker asked him to find out if he could obtain cars in the second-hand market that would be "just as good" as the new cars he wanted. Naturally this was discouraging, but the manager set out to prove that by no stretch of the imagination could cars cast off elsewhere be the equal of new ones for his own property.

Practically all the changes which have been incorporated in modern electric railway equipment have been included with the idea of making the cars earn greater profits, for after all the purpose of a railway is to earn a return on its investment, whether it is a private company organized for profit or a municipality pledged to give service to the community. The innovations are generally made to increase speed, safety, comfort and appearance. Some changes are primarily to reduce operating expense, but usually they cannot be considered apart from the others.

Four Essentials for Present-Day Equipment

WHILE the several elements that make for improvement in these various lines have been the subject of articles and editorials in this paper from time to time a recapitulation gives a means for the management of any property to check up and determine if its equipment really is modern.

Speed is a relative quantity. What is desired is not necessarily a high maximum velocity, but a high average from one end of the run to the other. This involves many elements. The car must be light enough in weight that a reasonable motor equipment can handle it. The motors must be sufficiently powerful to accelerate the car quickly and to maintain a reasonably high maximum speed. The structure must be strong enough to withstand the strains incident to a hard schedule. Brakes must be reliable and must give smooth and rapid retardation. So much for the movement. The modern car must also be designed to minimize the lack of movement, or standing time. There must be facilities for rapid collection of fares to prevent waste of time. For the same reason there must be effective control of passenger movement within the car. It must be easy for the passengers to board and alight quickly to prevent delays to car movement. This involves the design of doors and door mechanisms that work surely and swiftly.

Safety likewise demands full control of a number of elements. Efficient and reliable brakes have been referred to already, as have high quality of materials and correctness of design. The steps must be of proper height and width and there must be convenient arrangements for ingress and egress. Positive signaling systems are needed if two men operate the car and in any event there must be positive control provided to insure closing and unfailing action of the doors. Automatic protection of the passengers in the event of incapacitation or carelessness of the operators is now considered an essential.

Comfort demands attention to many details. The seats and the seating arrangement must be satisfactory. There must be ample heat and light and good ventilation. There must be freedom from roughness in handling the equipment. Proper facilities must be provided for the operator, and the automatic features must be simple and easy to work with. Arrangements to prevent crowding around the doors and in the aisles are also factors in promoting both comfort and safety.

Appearance, which is considered so essential today, requires good architecture and departure from conventional design. The latest models have low headroom and clear vision for passengers and operators, particularly the view ahead. Lines must be graceful, both inside and out. Unsightly apparatus either must be redesigned or concealed. Interior appointments must be good, the floor covering attractive and the accessories must harmonize with the design. A pleasing decorative scheme, both on the interior and the exterior, is essential. The signing should give the patron a means of choosing the right car without hesitation.

These features have their primary effect on the earnings of the car. It stands to reason that the parts should be designed for maximum efficiency in operation. The equipment should be easy of maintenance and it should need but little time in the shops, where it is unproductive. Anything that reduces the standing time of the car promotes speed, and in turn reduces operating cost per unit of service rendered. Safety features likewise reduce accident expense. Features that permit the use of one man instead of two reduce platform cost. Lightness of weight reduces the cost of energy, wear on track and paving and wear of the car itself.

Few cars so far designed and built embody all these desirable characteristics. Often pet ideas of the designer or of the operator militate against the attainment of all the best points in one structure. However, as the principles of modern design are becoming better and better understood there is a distinct trend toward the inclusion of more and more of the desirable features, with the result that the latest cars are far in advance of those built a few years ago. As to the financial results, the statements of many railways bear ample witness of their success.

This is the issue in December that is devoted essentially to maintenance and construction subjects

Growing Pains

FOR the past several years the mass of workers on Chicago's transportation systems have been subjected to management policies and influences which have gradually permeated through to the lowliest platform recruit. Square dealing has been the first rule in that policy—square dealing flanked by sincerity and backed by courage and firmness. No compromise has been tolerated regarding the joint responsibility of management and labor to protect the public's interest. The principle has been firmly maintained that transportation systems are run to serve the public first and to earn a fair return to capital and labor second. The worker who would serve his own interests or gratify his own feelings at the expense of his patrons has been classed as an unfit employee for a public service company.

Management expects co-operation because it merely shares with the workers the responsibility of providing safe, dependable, efficient and courteous service. It insists upon obtaining this co-operation in full measure. In return it gives intelligent and expert direction, impartial justice, sympathetic understanding and courageous leadership. This is the creed that has gradually permeated into the ranks of Chicago transportation workers. In the day-to-day contacts between men and management, the principle of fair dealing has been put not so much into words as into action. So it was inevitable that deep-seated currents of readjustment should be set in motion.

New leaders arise to question reactionary labor thinking. Old leaders, failing to grasp the full import of new conditions, struggle to maintain their prestige and influence. Thus events which in themselves may confuse the casual observer are better understood when underlying forces and influences are perceived. For many years the mental attitude of Chicago transportation labor was far from healthy. Present symptoms indicate an acute case of growing pains.

Increased Attention to the Power Drives of Railway Shops Will Pay

IN THESE times of high costs for labor and materials, electric railway managements are interested in anything that will reduce expenses. One thing that has not received the attention that it deserves is the mechanical power drive used in shops.

If railway shops were part of an industrial plant, experienced mechanical power transmission engineers would be engaged to make certain that shafting is in accurate alignment, that pulleys are of proper size to develop highest efficiency for the individual machine tools, that belting is of a class to give longest service with low maintenance cost and freedom from interruptions, that all excessive slippage is eliminated, that modern lubrication practice is followed and that excessive friction from plain bearing transmission equipment is avoided. Since by some persons railway shops are thought of as only repair shops, little attention is given by them to the factors that enter into efficient mechanical drive. As long as a machine tool will operate at a speed somewhere near what is expected the drive is assumed to be all right.

To show how easy it is to let bad practices creep in, a recent inspection by a belting engineer in one shop showed that there was a power loss of nearly 50 per cent between the driving motor and the group of machines served. A few very simple changes brought the efficiency up to normal.

Nearly every electric railway shop has a wood mill, where there is an accumulation of dust. Dirty belts have excessive slippage and as a result there is rapid wear of the belts themselves and of the pulley faces. Belts used in such a place should have a tension higher than normal, or else there should be large arcs of contact on the small pulleys to prevent slippage. A common method of obtaining a large contact arc is by use of a gravity idler. Composition pulleys sometimes help reduce slippage. Where an accumulation of dust cannot be prevented on belts it is especially necessary to consider the quality of the belt material used, as long life and low maintenance cost can best be obtained by having a pliable, tough and strong belt. The type of fastening used for belts is also an important factor in preventing interruptions.

Enforced idleness of a machine at a time when it is urgently needed may cause a car to be held in the shop much longer than otherwise. Its earning power is thus decreased, although the fact may not be known to the management. It should be the duty of the shop foreman to show just what is needed to get production standards in the shop up to the most economical point, and specifically to point out conditions that he cannot remedy with his own forces.

In looking for additional opportunities to decrease costs during the coming year general managers will do well to have conditions of the mechanical power transmitting equipment in shops investigated and make desirable changes.

Many Important Considerations Enter Into Comfortable Seat Design

COMFORTABLE seats in cars are essential if passenger riding is to be increased. Until a few years ago electric railways gave little consideration to this most vital question. A seat which would not wear out and which reversed satisfactorily if used for double-end operation, or stood up rigidly for single-end operation, was good enough. Some of the blame for this indifference may be laid to the manufacturer, but operators did not take readily to the idea of providing comfort for the riders, particularly when it was found that improvements would increase costs.

At present there is somewhat of a tendency to go to the other extreme without thought of longevity and ease of maintenance of the seat itself. Many of the experimental seats installed may be classed as comfortable, but freedom from maintenance trouble appears to have been given insufficient consideration.

A high seat back that provides a head rest for the passenger, even though correctly designed, is not necessarily comfortable, because all too often the rider cannot take the proper position due to too close spacing of the seats themselves. A cushion can be soft and yet uncomfortable, particularly if care is not used in determining the height above the floor. Cushion heights from 19 in. to even 22 in. are used too commonly, when a 16½-in. to 18-in. height should be a maximum. To use the lower height satisfactorily, study should be made of heater side wall and design of the car in relation to the seats themselves.

If it becomes necessary to replace seats in a few years, the cause of comfortable seating will get a setback, but this is inevitable unless great care is used in securing a seat that is not only comfortable but is so ruggedly

Digitized by Google

constructed that it will stand the severe service required and do so without excessive cost of maintenance. Seats for passenger cars cannot be built like parlor furniture and be expected to stand up in service. The springs should be tempered so as to give proper deflection without taking a set and the spring units should be designed and constructed to give an absolute minimum of upholstery deformity. Many years have been spent in studying upholstery foundations for car service. The lessons learned should not be disregarded.

Comfort in seats has emphasized the necessity for use of softer covering. Canvas-lined rattan unquestionably is an excellent covering for withstanding wear. It is easy to maintain in a presentable condition. This covering, however, is being replaced to a great extent by plush and genuine leather, although recently soft and comfortable seats have been designed to utilize the excellent qualities of rattan in combination with leather or plush. For certain kinds of service this combination works out satisfactorily.

O'Fallon Case Did Not Decide Valuation Basis

NOT until the Supreme Court of the United States passes upon the matter will the so-called O'Fallon railroad valuation case be settled. In the decision just rendered, the Federal Court for the Eastern District of Missouri sustained the order for recapture of earnings issued against the O'Fallon road after modifying it in one particular. The court held the commission's determination valid with specific reservation that the methods used in arriving at a value on which the per cent of earnings is calculated should not enter into the case. The two circuit judges, Kimbrough Stone, who handed down the decision, and Arba Van Valkenburgh, agreed on this point. The district judge, Charles B. Faris, concurred in the judgment, but expressed the opinion that the commission's valuation method was justified, although defective in some particulars. The two circuit judges held it unnecessary to go into the basis of valuation or the question of confiscation, because the road earned more than 6 per cent on the full valuation claimed by it. They said that under such circumstances a claim of confiscation could hardly be made. The decision read in part:

> It seems that the contention of the United States is well founded; that the verity of the commission's valuation herein need not be examined and cannot affect the recapture order, and that therefore such order is not open to attack upon the grounds of wrongful valuation. If this be true, it is unnecessary to examine and determine the various contentions made by the parties and *amici curiae* concerning the proper manner of ascertaining value hereon.

In his comments, Judge Faris said that a valuation arrived at by the sole use of either the "prudent investment" theory, based on the cost when constructed, or on the present cost of reproduction new less depreciation, would work presently to the public and eventually to the carriers themselves such monstrous iniquity as to preclude wholly the use of either of such methods exclusively, and would eliminate the notion that Congress contemplated the exclusive use of either of such methods.

Summed up, the court held that 6 per cent upon the value affixed by the commission on the O'Fallon property, plus one-half of what it termed "excess earnings" for the several years considered, taken together, constitute a fair return upon the value of the property even as claimed by the carrier. The court thus saw no necessity for concerning itself with the commission's valuation or with the method of the commission in reaching its conclusion.

The Theory on Which the Commission Acted

THE O'Fallon case was the first decision by the Interstate Commerce Commission interpreting and applying the so-called recapture c ause of the transportation act of 1920. Since no definite rule of valuation was laid down in the transportation act of 1920, the commission proceeded on its own initiative. By a vote of 6 to 4 it held in effect that the value of the property for rate-making purposes, as determined by the commission for 1914, approaches more nearly the reasonable and necessary assessment on the property than the cost of reproduction of it. It felt warranted in basing the valuation on its tentative valuation figures of 1919 (based on 1914 unit prices) as far as available, allowing for property added in succeeding years at actual cost less depreciation, without giving effect to the cost of reproducing the original property at present-day prices. The idea of cost of reproduction new at prices current on the valuation date, laid down as a rule in previous court decisions, was rejected by the majority of the commission on the ground that it would prevent stability of rates and that it was unjust and unworkable. Between that method and the use of 1914 prices as a base, the commission held no intermediate practice was "possible which is capable of being applied to any rule independent of the caprice of those who apply it."

The theory upon which the commission justified its adoption of 1914 prices appears to be that that price level is one which will be fair to all concerned. The idea of the commission seems to be that if the carriers are protected in their right to earn a fair return upon a value for physical property so determined, with some allowance for going concern value and working capital, fixed in the discretion of the commission, the roads will have no ground for alleging confiscation and will have received all the returns that can justly be claimed by owners of property who have voluntarily dedicated it to the public service.

These comments, it is believed, summarize the various points of view of the commission and the court correctly. So far as the railroads are concerned, the opinion of the general counsel of the Association of Railroad Executives is to the effect that even admitting that the road might be receiving a fair return upon its own valuation figures, the decision had the effect of preventing the road from receiving a return as great as Congress deemed it entitled to receive. The feeling of the railroads appears to be that the court decided the case without consideration of the correctness of the value placed by the railroad on its own property.

It is understood that the Supreme Court will hold an open session on Dec. 19 to consider motions for perfecting an appeal. It is expected that in that proceeding the issue will be decided of whether the highest court will finally direct the commission to give greater weight than it appears to have done to the present reproduction cost as one of the criteria of values and perhaps also whether it will direct the commission to accompany its findings of value with a definite statement of the manner in which it gave weight to reproduction cost. Should the court by chance decline to pass upon the valuation and confiscation questions and affirm this adverse ruling the railroads wou'd be back where they started.

IMPROVE MAINTENANCE

in Chicago Shops

MANY improvements made recently in shop practices and equipment of the Chicago Surface Lines have resulted in greater efficiency and output and reduced maintenance costs. On a system the size of the Chicago Surface Lines shop work is important. Many details of maintenance practice and equipment are given in the company's brief for the 1927 Coffin Award. In the two principal shops of the system there are 34 persons in a supervisory capacity and 978 employees. In the repair and cleaning departments of the car stations there are 64 supervisors and 1,361 employees, making a total of 98 in supervisory positions and 2,345 employees. Some of the shop practices are given in the following paragraphs.

In overhauling motors one of the first operations is to remove the armature. Considerable time and labor have been saved in the removal of armatures from box frame motors through a special device built in the shops. It consists of a hinged tripod, two legs of which hook into the motor commutator cover hole, while the third leg hooks into the bottom inspection hand hole. Pressure on a jack placed between the apex of the tripod and the end of the armature shaft causes the armature to push the pinion end bearing housing from its seat, after

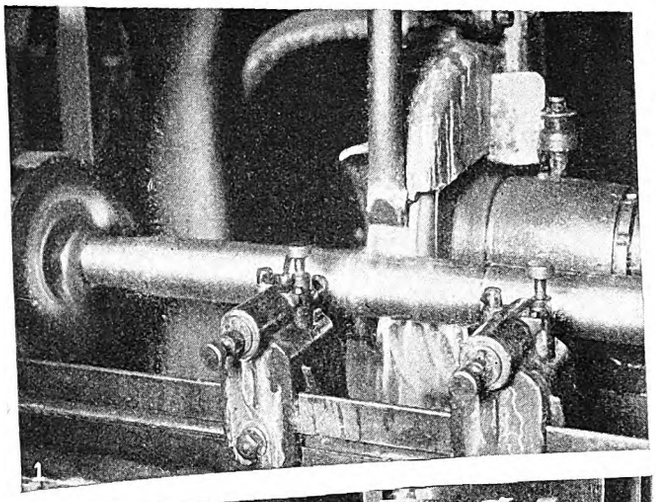
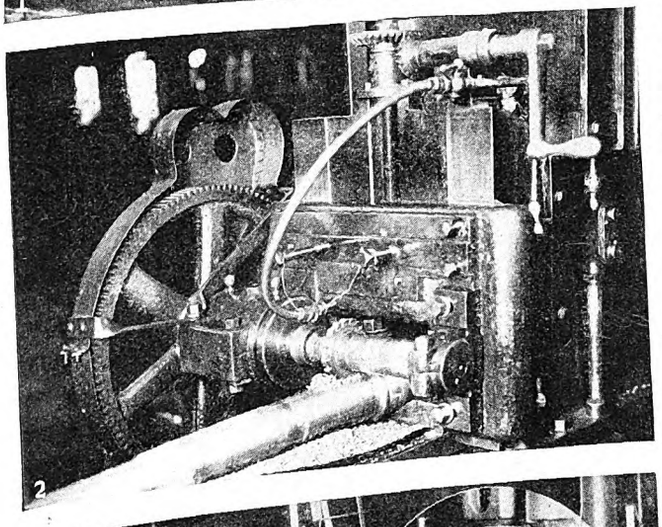
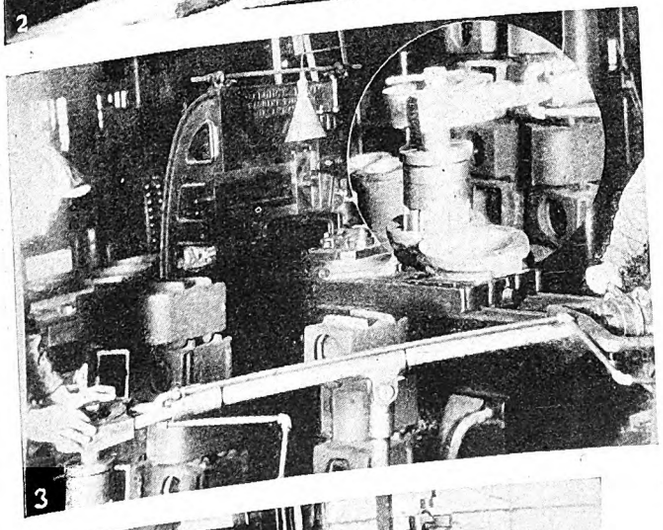
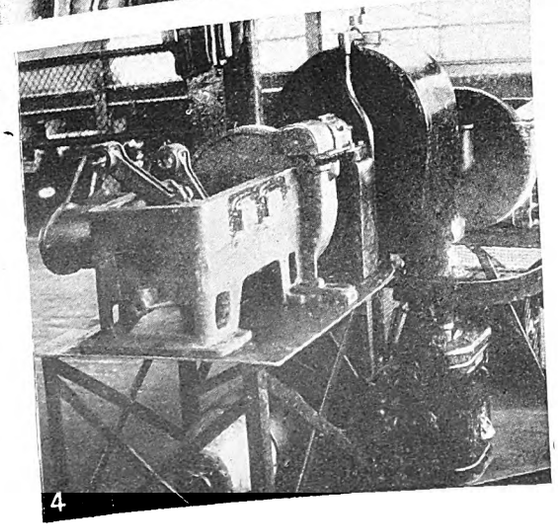
Heater units (at right) are placed below plates which support containers for insulating compounds. One of these units is shown in the insert.

Digitized by Google





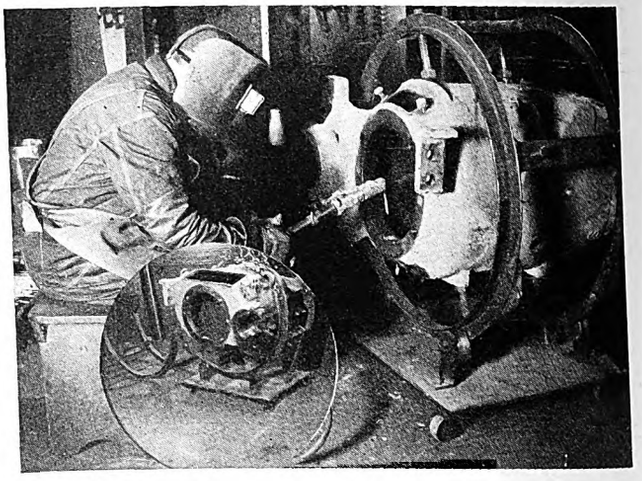




which the armature can be withdrawn from the frame without difficulty.

The practice of dipping and baking armatures is carried out very carefully. It has been followed since 1922 and extensive facilities have been provided for the care of the 12,000 armatures used by the system. Details of some of the baking oven equipment by which the capacity was increased considerably were given in ELECTRIC RAILWAY JOURNAL for March 20, 1926. The method of storing armatures during baking so as to get a maximum number in a limited space is a particular feature. Clamps for handling armatures by the overhead rail conveyor system with chain hoist have assisted materially in rapid handling and also in reducing the amount of labor necessary.

Control of the oven temperature at the South shops of the railway is by means of a seven-day clock and contactor panel. The clock controls four heat circuits. Three sets of heaters are turned on at 4 p.m. and off at 6 a.m. each day except Saturday, while the fourth is under thermostatic control during those hours, so that it cuts in and out as the temperature varies in the oven.



Circular fixture for supporting motor frames during welding

At the West shops of the company three circuits of heaters are used, two being under thermostatic control established through a contactor and quick break switch, actuated by a length of No. 00 copper trolley wire placed at the top of the oven and anchored at one end so that all expansion must take place in one direction. As the temperature rises the expansion of the rod causes the switch to operate at a predetermined point. This control and quick break switch are of shop design and manufacture, but have been found more reliable than some other types of thermostats.

Insulating compound is also used on the inside of motor shells. For heating this compound an electric heater made of six 1,000-watt heater units has been placed below plates which support the compound containers. The heating compound is poured into the

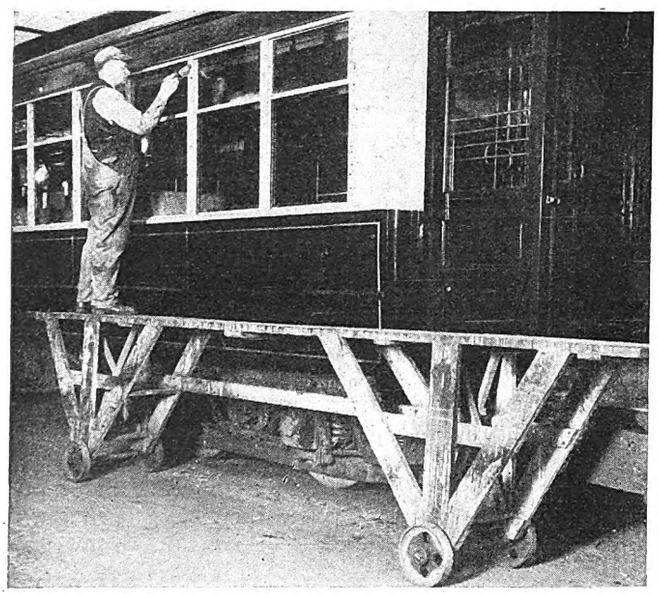
motor frame. By rotating the frame about its axis the compound fills and insulates corners and surfaces that are inaccessible to a brush. A system of taps and switches has been devised so that the same current used in the compound heating element can be used in the testing of polarity and insulation of the motor. Polarity of fields is checked with a compass.

Where the housing fits in railway motor frames are worn it is the practice to build these up by welding and then to rebore them. To assist in handling the motors conveniently while welding a special fixture has been constructed. This consists of a circular cage formed from a hinged framework mounted on a truck with small roller castors. The motor in its cage can be hauled about to a convenient location for welding and also transported for assembling. To place a motor case in the cage the upper half is swung back on its hinges



Low portable scaffold used for painting the upper parts of car body sides

and the motor is placed in the lower portion. The top part is then closed into position and the clamping studs around the outside are adjusted to hold the motor rigidly. The cage rests on rollers at the bottom so that it can be rotated with the motor case inside. It is thus possible for the welder to place this in any convenient position and the welding work is not hampered through the operator having to work in a cramped position.

After welding, the motor frames are rebored in a twelve-tool boring machine, which is essentially a four-spindle horizontal boring mill. The four spindles are grouped in pairs of two in such a manner that all four bores are completed at the same time. Speeds can be adjusted to suit the thickness and hardness of the welded material in each built-up frame.

Armature shafts are turned out on a production basis in the Chicago shops on a group of machine tools. The rough shafting is first centered and then rough-turned

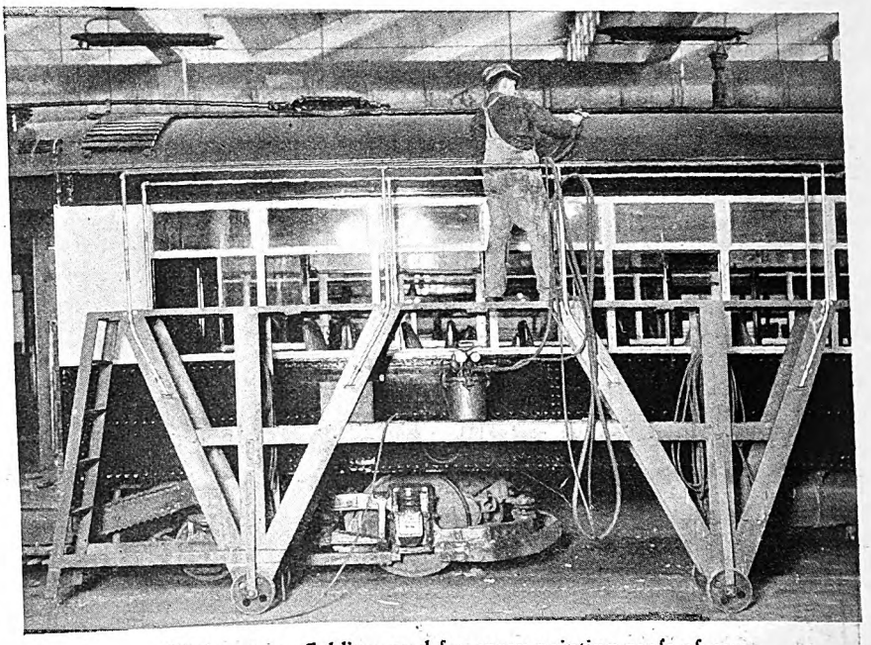
Digitized by Google

in an ordinary heavy-duty engine lathe. Finished turning is done in a low-swing lathe which has multiple tool posts. The saving in time resulting from the simultaneous use of four, five or six tools, combined with the use of cooling fluid, greatly reduces the cost of manufacture. A Landis grinder finishes the shaft to the required size. Finally, after threading for the pinion nuts, the keyways are cut.

All armature shafts are made of chrome-nickel steel. With this material, which has been the standard of the railway since 1921, breakage of shafts has been practically eliminated.

In the compressor overhauling department new rings and pistons are fitted to compressors until the bore has reached $\frac{1}{16}$ in. oversize, at which time a sleeve is fitted to bring the cylinder back to standard. Cylinders worn out of round or tapered are refinished with a special reamer. It has a micrometer adjustment and a true, smooth surface is secured. After a crankshaft is fitted the shaft is run in the bearings with a special machine. Two compressors can be run in at one time. Besides running the bearings, the machine is used to check the tightness before the motor is assembled. A power grinding attachment arranged for seating intake and exhaust valves has proved a great time saver and produces accurate work.

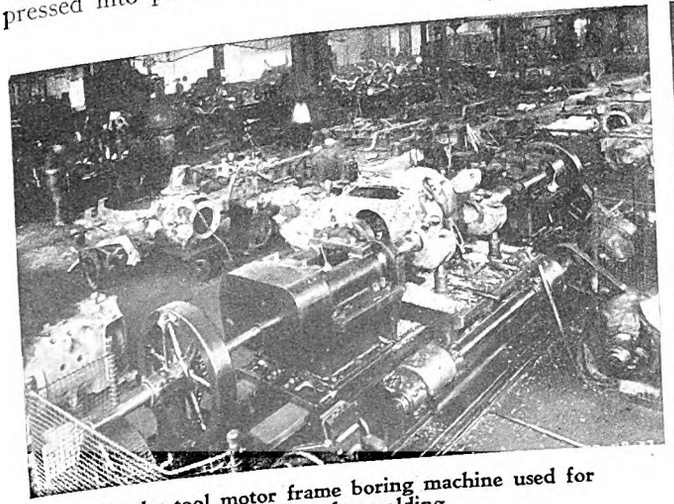
The wheel press used in the Chicago shop is so equipped that two wheels can be pressed on the axle at one time. The new equipment required to adapt the machine to double end pressing includes a U-shaped block similar to the one used on the piston end. This is placed in such a way that the thrust is taken by the hub of the wheel instead of by the end of the axle. Whenever it is found that the fixed end wheel will be pressed on farther than the gage mark on the axle before the other wheel is in its proper place an emergency stop, consisting of a block of iron, is slipped into a groove in the U-shaped fixed stop, after which the thrust is taken by the end of the axle and the second wheel can be pressed into place. If the piston end wheel arrives at its place first the iron block is placed between the piston and the axle end and the pressing on of the other wheel is completed. This procedure increases the production of the press by 90 per cent.



High type scaffolding used for spray painting roofs of cars

Many improvements in methods and equipment have been made in other shop departments. In the wood mill the edges of door stiles and rails are formed in a machine with two horizontal spindles, using shimer head cutters so that both edges of a piece passing through can be finished at the same time. Presses have been constructed to give pressure to vestibule corner posts and other large members after they have been glued. These presses hold the parts in position firmly until the glue can set. An improvement in platform flooring has been made through the use of an improved type of tongued-and-grooved flooring. A special machine is used for cutting this. This type of flooring gives much longer life than the usual type. Repairs to seat cushions are made without removing any part of the seat by the use of a special staple driver. An accompanying illustration shows its construction and use.

Work of painting the sides of cars has been facilitated greatly through the use of several types of rolling plat-



Twelve-tool motor frame boring machine used for finishing after welding

Digitized by Google

forms. These platforms are made of different heights so that workmen can reach all parts readily. They are mounted on large wheels so that they can be pushed along by the workmen without getting down from the platform.

An average of 4,870 cars are given a general washing each week on the Chicago Surface Lines. To aid in this work a fountain brush has been designed. It is so arranged that water is sprayed through the brush bristles directly on the car surface. Dirt is loosened with the brush and the steady flow of water flushes off the loose dirt. Care has been taken to prevent the use of water at higher pressure than necessary to secure a uniform flow through the brush. This prevents the entrance of water into cracks or crevices of the car and prevents the deterioration which is usually experienced where high pressure cleaning systems are used. Low pressure water also makes working conditions for the men more comfortable.

But four men are required to clean a car. Long and short handles are supplied to the fountain brushes and a special brush is also used to clean the glass behind the window bars. Periodically the cars are given a thorough interior cleaning and are swept and dusted after each day's run.

The care used in inspecting and purchasing repair parts which go into cars is illustrated by the attention given to securing uniform heater coils. To make certain that all coils have the correct resistance for the circuit in which they are used, independent of the resistance of the wire purchased, a special testing equipment is used which is an adaptation of the Wheatstone bridge in which a known resistance is balanced against the heater coil being tested. The known resistance is a standard heater coil. Coils are wound on a mandrel and are cut to such a length that the resistance will balance with that of the standard coil. In the illustration on page 1092 showing this test equipment a dry cell furnishes the electric current. The galvanometer to show when a balance is obtained is at the top of the board and the coil under test is around the outside.

Attractive Depot Completed at Santa Rosa

COMPLETING a new combined passenger and freight depot, costing approximately $30,000, the Petaluma & Santa Rosa Railroad has given to Santa Rosa what is said to be one of the finest depots in northern California. This road operates an electric interurban in Sonoma County between Petaluma and Santa Rosa via Sebastopol and a steamboat line on San Francisco Bay between San Francisco and Petaluma.

Of modernized mission style of architecture and tastefully decorated, it is a distinct improvement over the former structure. It provides for the traveling public a commodious waiting room and ticket office separate from the freight warehouse. The building has a frontage of 84 ft. on Fourth Street, one of 270 ft. on Wilson Street and a total floor space of 25,000 sq.ft.

The passenger end of the depot, with its entrance on Fourth Street, the principal business street of Santa Rosa, is constructed of reinforced concrete, with a stucco finish and tile roof.

The adjoining freight warehouse, devoted entirely to the receipt and delivery of l.c.l. freight, has a 270-ft. frontage on Wilson Street and a 47-ft. frontage on Third Street. Inside dimensions are 40x250 ft. The floors of the warehouse and the 7-ft. platform on the car side are of concrete. The vehicle-loading side is fitted with Cahill roller steel doors, 16 ft. wide and 12 ft. high, and has a 4-ft. marquee extending the full length of the building. A concrete drive, also the full length, adjoins the paving of Wilson Street. The opposite side is served by two tracks, each having a five-car capacity.

The change in location necessitated a complete rearrangement of the tracks. The accompanying diagram shows the present arrangement in solid lines and tracks removed in dotted lines. Driveways and track changes cost $10,000.

Before the contract was let the railroad company prepared for building by tearing up the tracks and getting everything in readiness for construction, so that there was no interference with the business of the company and service was given as usual while the work was in progress.

W. G. Rennison, chief engineer of the company, supervised the construction of the station and all changes made in the track and driveways.

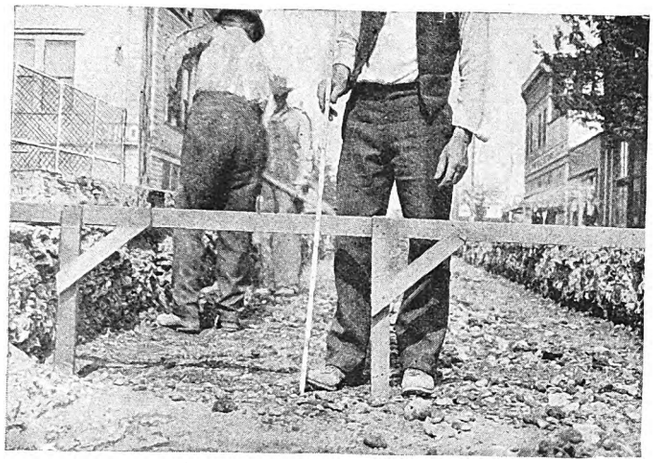
The material was loaded into trucks with a clamshell bucket

RECONSTRUCTION of 2,300 ft. of the main line street car tracks through Oregon City, Ore., proved a difficult problem for the Portland Electric Power Company, owner of the local street railway system. The line carries a considerable quantity of freight to the paper and woolen mills in addition to handling the regular interurban passenger service between Oregon City and Portland. The main business district of Oregon City lies on a narrow bench between a high bluff and the Willamette River, and practically all vehicular traffic must pass over Main Street, on which the railway line is located. The track and pavement had deteriorated to such an extent that it was decided to rebuild the entire structure. Because of the heavy traffic, both vehicular and rail, it was necessary to complete the work in a minimum period of time. The subgrade of Main Street, composed of poorly drained subsoil, offered another problem to solve.

The method of reconstructing the old track, as outlined in an article in *Construction Methods,* is very interesting. The old Belgian stone block surface in the track area was removed and salvaged. The ties, which were imbedded in concrete, were removed with a portable crane mounted on a truck. A large pointed hook was fastened to the end of the crane cable and this hook was driven into the ties with a sledge. After the ties and rails were taken out there was left a mass of loose material to be removed. The large chunks of concrete, which may be seen in an accompanying illustration, were salvaged and later used for riprap. The trench was excavated with a tractor and Fresno, starting at one end of a section, dumping at a predetermined point, continuing down the trench and bringing back material. The waste material was then loaded into a truck with a clamshell bucket crane. The completed trench was slightly more than 8 ft. wide and 21 in. deep, a template being used to obtain

Digitized by Google

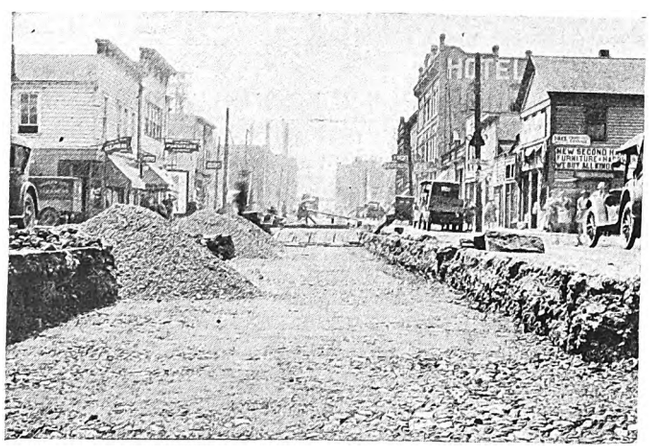


Obtaining a uniform thickness of 21 in. with a template

a uniform thickness. The subgrade was finished by compacting with a roller.

On this subgrade an asphaltic concrete base approximately 8 in. in thickness was laid. Large aggregates were used in the material, which was laid in two courses. Over this base a thin layer of screenings was spread, on which the new track was placed. The track was brought to grade by working the screenings under the ties where necessary. The space between the ties and under the rails was then filled with asphaltic concrete base mixture, hand tamped into place. The rails were painted and another course of the base mixture laid above the ties. On this second course the surface pavement was laid, bringing the wearing surface to final street grade.

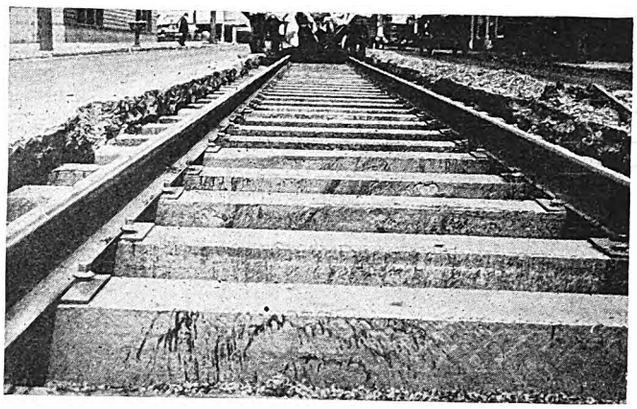
In making the asphaltic concrete, the maximum density type of mixture was used throughout. In the base course a fairly large-sized rock was used, the maximum being



The finished asphaltic concrete base. A coating of fine screenings was spread over the base course

2½ in. In the surface course ½-in. maximum sized rock was employed. Asphalt of 51 to 60 penetration was used in the mixture, the base courses carrying approximately 4.5 per cent and the surface courses carrying approximately 6.7 per cent.

The work was done under the supervision of Thomas Pumphrey, chief engineer of railways for the Portland Electric Power Company, working with J. R. Stafford, city engineer of Oregon City. The contractor was the L. O. Herrold Company.



The ties and rails were then laid and the track brought to grade

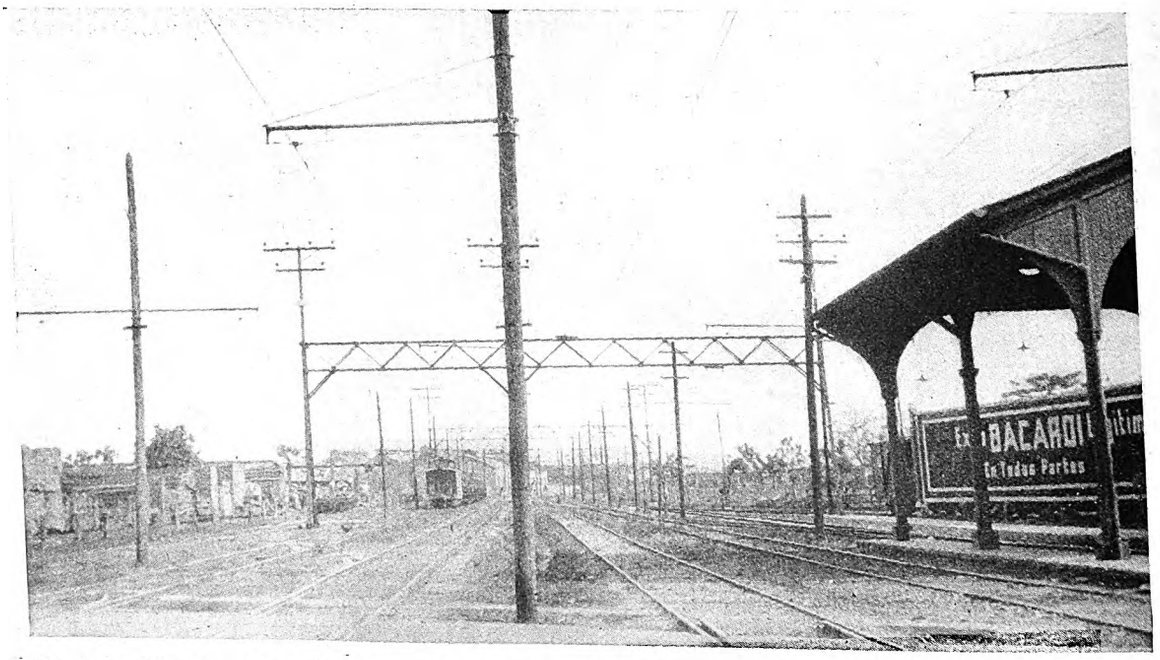
Catenary with Unusual Pole Spacing

Withstands Cyclone

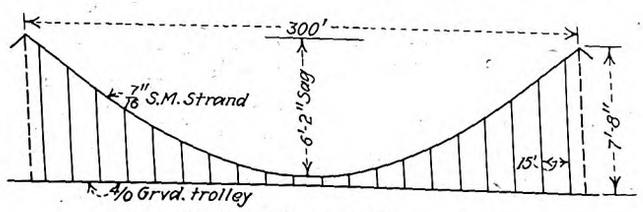
By L. W. Birch
Line Material Engineer Ohio Brass Company, Mansfield, Ohio



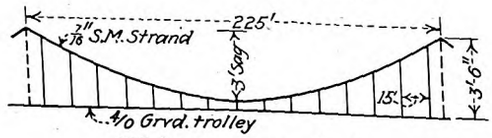
On the multi-track sections the catenary is supported on steel bridges with 300-ft. spacing. In this view is seen the catenary suspension and the direct-suspension trolley which it replaced

EARLY in 1923 the Havana Central Railroad began a study of overhead systems, expecting at some future date to replace the existing overhead with something more positive and economical. The result of this study was the selection of a light catenary system suitable for long spans and capable of replacing the existing direct-suspension system with a minimum amount of pole relocation. This work was started in 1924 and has been continued steadily, until at the present time the Havana-Rincón Division and the four-track section leading from the Estacion Central through the yards have been completed. Plans are made to continue this rebuilding until the overhead system will be entirely reconstructed.

A program of this nature cannot be carried out with the same speed and consistency as a new installation. Such factors as traffic, change of height of system and utilization of existing wood poles and structures are responsible for much delay and changes throughout the construction program.



300-ft. span on steel bridges

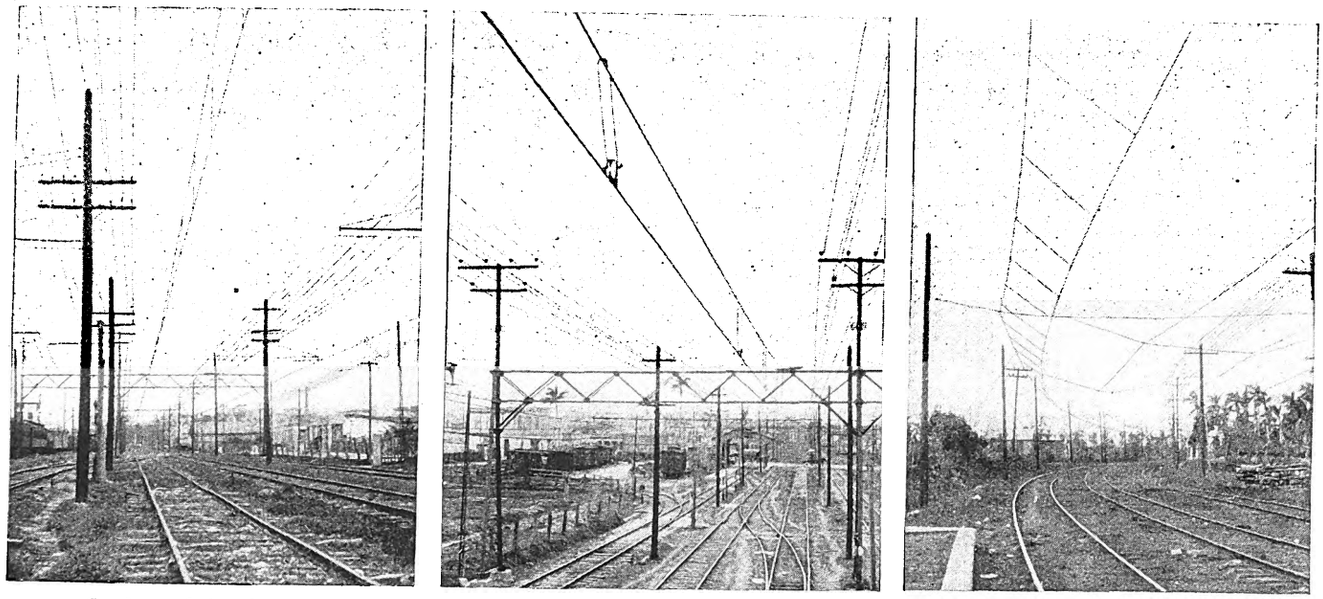


225-ft. span on wood poles

The Havana Central Railroad is a subsidiary of the United Railways of Havana & Regla Warehouses, Ltd. The company was incorporated in 1905 and acquired the right of the then Insular Railway for the construction of 120 miles of road radiating from Havana as the central point. Construction commenced in 1907 and at the end of 1923 a total of 62 miles of railway had been built. In 1907 the stock and bond issues of the Havana Central were bought by the United Railways of Havana.

The Havana Central thus became a part of the largest railway system of the island of Cuba. Its entire system is electrified, while the Western Division of the United is electrified as far south as Rincón and throughout several shorter suburban lines. The electrified lines provide excellent suburban service through three lines radiating from Havana, located approximately 45 deg. apart. They are Havana-Guanajay, 30 miles; Havana-Güines, 32 miles, and Havana-Rincón, 15 miles. The systems are supplied with power from the company's power

Digitized by Google



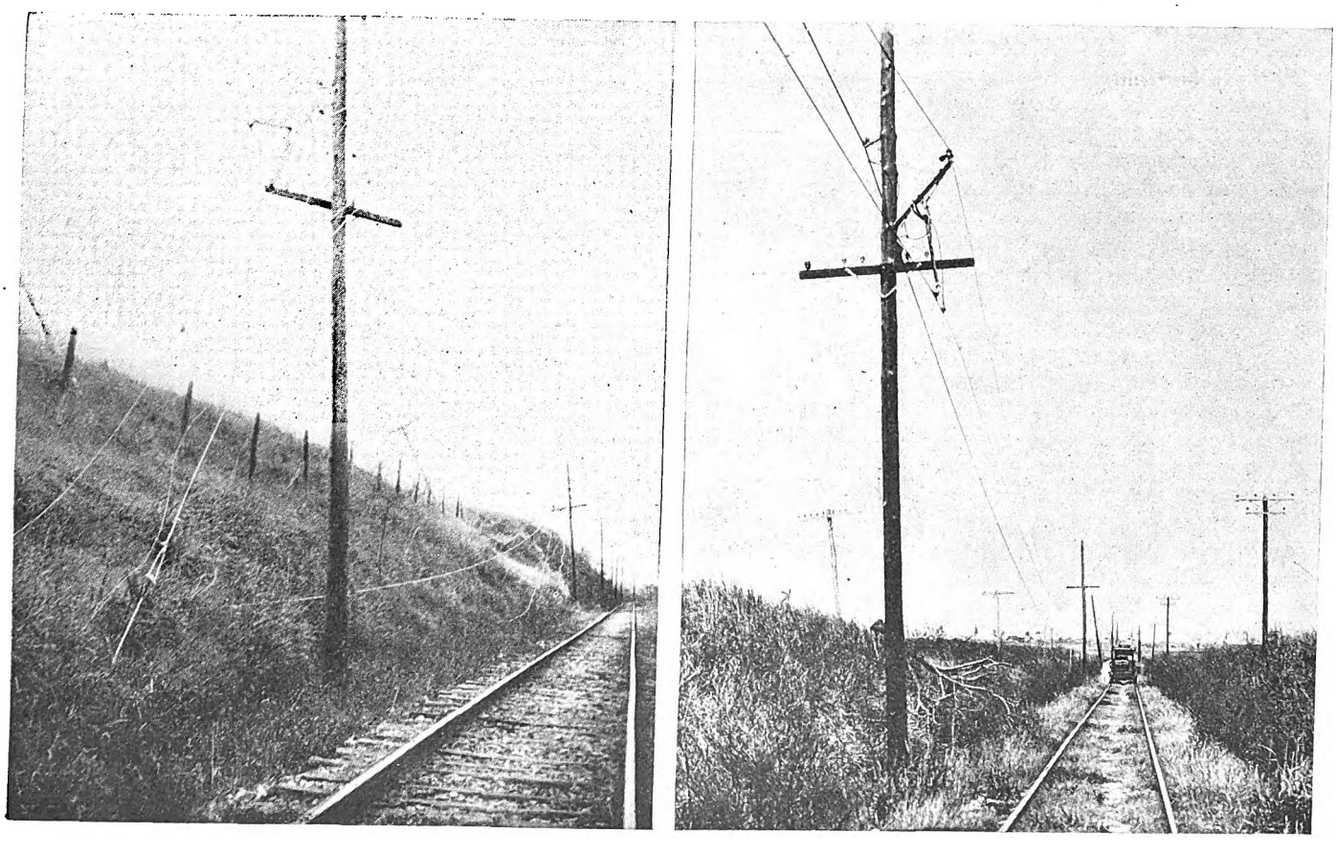
Sections of the electrified line showing the old direct-suspension system being replaced by catenary. In the center view is shown one of the steel bridges used for a portion of the line

house, located at Havana, at a trolley voltage of 600 d.c.

In the overhead construction, to reduce accident hazards, increase signal visibility and facilitate switching in the yard sections, long spans and considerable side clearances were necessary. In this case consideration of existing structures and poles was unnecessary. However, on the single-track main line divisions, where the wood poles were spaced 112 ft. with direct suspension, the problem of utilizing many of the existing poles was encountered.

The poles, due to proper maintenance, were found to be in good condition. Naturally, initial cost suggested the use of present pole locations, rather than entire relocation. But a pole spacing of 112 ft. is not inviting to the engineer wishing to show a low first cost on the installation. Neither is it attractive from the maintenance standpoint, because in a humid climate pole maintenance is greater than usual.

The result of a careful investigation of the yard work was the choice of a 300-ft. simple catenary span constructed with a $\frac{7}{16}$-in. Siemens-Martin messenger wire and a No. 0000 grooved contact wire giving a total weight per foot of 1.0 lb. Both the messenger wire and trolley



Appearance of 225-ft. wood pole catenary after the cyclone passed. The overhead was quickly realigned and operation resumed in record time

Digitized by Google

wire were strung at a tension of 2,000 lb. at the normal temperature of 80 deg. F. The system was supported from latticed steel bridges which also carried pole extensions for a double-circuit three-phase, 33-kv. transmission line. The messenger wire was supported by 35-kv. pin type insulators mounted on the top chord of the truss. Owing to the slight curvature on this section the overhead was aligned with the track by attaching pull-over wires to intermediate Bates poles. Steady wires were placed at each structure.

On the single-track line it was found economical to continue the same tension and span design. The span length was decided by choosing every second pole location. This produced a 225-ft. spacing, which is 75 ft. greater than the usual spacing of wood poles on tangent track. However, with a temperature variation of only 25 deg. F. (70 deg. to 95 deg.) a favorable condition existed for this spacing, inasmuch as comparatively slight variations in mechanical loadings were encountered. Another favorable factor in the selection of the longer pole spacing was the soil encountered. Immediately around Havana there is to be found a fiery red soil, indicating a high iron content. It is not a clay soil, but is composed chiefly of decomposed limestone, sandstone and gypsum and is exceedingly good for pole foundations. Further, a single-circuit, 33-kv. line placed on top of the poles in several locations served to strengthen the line longitudinally. Poles were mostly of creosoted Southern yellow pine imported from the States.

On Oct. 20, 1926, Havana and the surrounding territory were badly damaged by a cyclone which, from the standpoint of wind velocity and loss of life, greatly surpassed the Miami disaster and preceded the Cuban cyclone by only three weeks.

The wind velocity registered on the government instruments previous to their destruction reached 100 m.p.h. Thousands of telephone, power and railway poles were leveled. The steel bridges on the four-track section of the Havana Central were supporting only the transmission lines. Consequently, little damage could be expected, and the actual damage was negligible. The single-track direct-suspension lines employing 112-ft. pole spacing approached a total loss. Poles were leveled, bracket arms torn loose and the relationship of the double trolley wires to ears and hangers was completely lost. The rebuilding of these sections was accomplished only by completely cutting away trolley wires from poles.

On the new catenary system, particularly the Rincón section, where poles were spaced 225 ft., the damage appeared to be as great as on the direct-suspension lines. However, after eliminating a few leaning poles, this damage was found to be small. The spans remained intact and the lines were quickly cleared and restored to an operating condition by realignment of poles and bracket arms. Very little time was lost through catenary maintenance, and it can be said the electrical department found it necessary to charge only a small per cent of its $236,000 cyclone figure to this account. The repair work, as well as the original building of these new systems, was accomplished by G. B. Fielding, signal engineer, under the direct supervision of J. A. Thomson, chief electrical engineer.

Trolley Car Operated by Radio

Little Rock Coffin Brief gives details of the demonstration that was conducted in that city

EARLY in 1927 the Arkansas Power & Light Company, which operates the street railway system in Little Rock, Ark., gave a demonstration that an electric car can be run through city streets safely without any one at the controller. The explanation perhaps should be made here that the company has no intention of trying to run its cars without operators. It was simply a matter of scientific interest and incidentally was a good advertising feat because thousands witnessed the trial, considerable space was given to it in the local press and a news reel was made by a moving picture company. The company's brief for the 1927 Coffin Prize contest gives particulars of the wireless system used.

To avoid any possible embarrassment through the failure of the remote radio control, a private demonstration was first given at the carhouse by the radio expert, Maurice J. Francill, who had charge of the trial. His success in controlling the movement of the car with a delicate 5-lb. instrument removed all doubt from the mind of the superintendent of transportation and his consent for a public demonstration was secured. Plans were soon made and a demonstration was arranged.

Operating a car in Little Rock by radio control

Considerable advance publicity had been given to the event, which took place in the downtown section of the city on the afternoon of Thursday, April 7, 1927, so that many people were on the sidewalks to see the trial.

At the proper time the demonstration car was brought from the carhouse to the downtown starting point on its own power. The radio expert followed in an automobile. After the brief ceremony of loading the Mayor of the city and a group of other distinguished citizens on the car the regular operator stood back and permitted the radio man in an automobile to start the car. He got off with a good start, running the car on two notches. At the street intersections the radio-governed street car complied with the traffic signals. It continued its run for about fifteen blocks.

As a natural precaution against possible accidents, the operator remained on the car in a convenient position so that he could take charge of it in the event of an emergency, but no such occasion arose.

The experiment has not been repeated, but the Little Rock company believes that it is the first electric railway company to have one of its regular cars driven through street traffic by radio control.

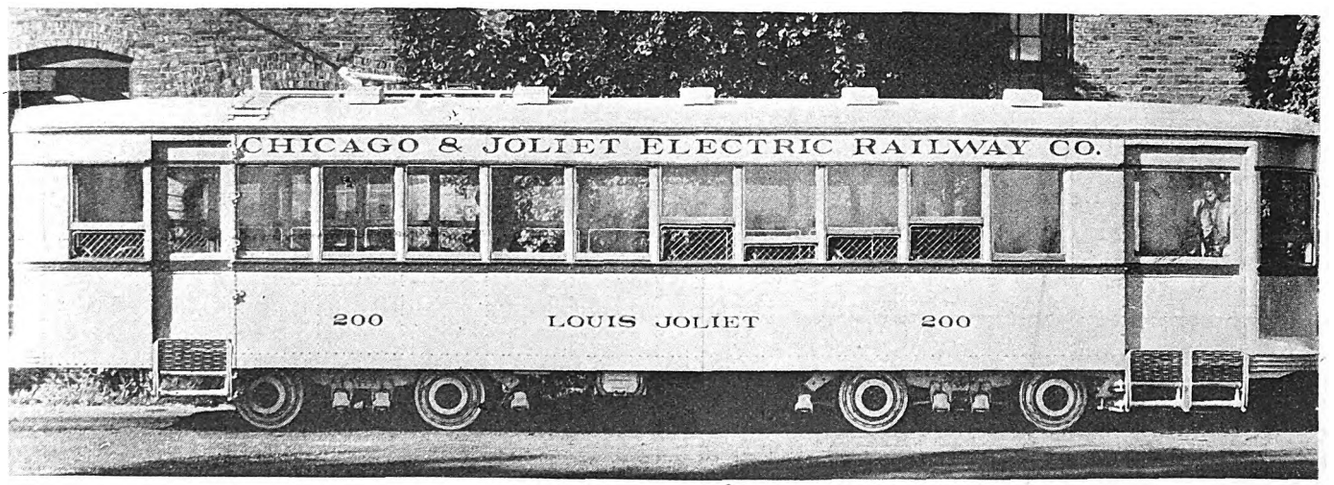
Light Weight Features Joliet Car

By J. R. Blackhall
General Manager Chicago, North Shore & Milwaukee Railroad
Formerly Vice-President and General Manager Chicago & Joliet Electric Railway



The front door opening is wide enough to afford both entrance and exit facilities. The rear door has treadle control

Use of aluminum in car body brings weight per seat to 475 lb. High acceleration and braking rates combined with slightly increased free running speed have reduced schedule time

EXPERIENCE in the use of lighter weight cars in city operation in Joliet, with the resultant savings in capital investment and labor costs and the possibility of maintaining faster operating schedules, seemed to point the way toward the attainment of similar results in interurban service. Accordingly ten cars for our interurban service were purchased to replace the heavier equipment then in operation. These cars were built according to the railway's design and specifications and included some features new to cars of this class. They are of two distinct types, although all are designed for one-man operation. Six are of the one-end type for through interurban service and four are of the double-end type for local interurban service. The cars were delivered and put in service in September, 1926.

The outward appearance of the ten new cars was carefully worked out with the idea of appealing to the riding public, which has been educated by the motor coach lines to expect parlor car appearance and equipment. Streamline effects and attractive color combinations helped in this matter. Concealment of interior equipment, such as switches and air piping, in mahogany finished cabinets added greatly to the attractiveness, and a final touch was obtained by the use of bucket type, semi-individual passenger seats of leather and plush. Interior lighting was of the semi-indirect type, eliminating all glare. Sliding doors replaced the conventional folding ones, adding not only to the general appearance but eliminating a good deal of noise and also reducing maintenance cost.

The new cars weigh 39,000 lb. each, as against approximately 62,000 lb. for the type of car they replaced. They have four 35-hp. motors, where the older cars required four 100-hp. motors.

Whereas the older type cars could not maintain schedules, due to the increasing number of stops per mile, the new light-weight cars have reduced the time between Chicago and Joliet by ten minutes with but slightly higher free running speed. Quicker acceleration and quicker braking are responsible. The public has been quick to appreciate the improved service thus offered as well as the increased riding comfort of the new type cars. An increase in traffic has resulted.

When the new cars were purchased it was estimated that a return of about $40,000 per year would be realized on the investment of $168,000 as a result of operating economies and because of increased patronage. The reduction expected in operating expense was figured at $30,000 and the increased revenue at $10,000.

New wage rates for operators put in effect in January, 1927, tend to reduce the saving, but a study of operating

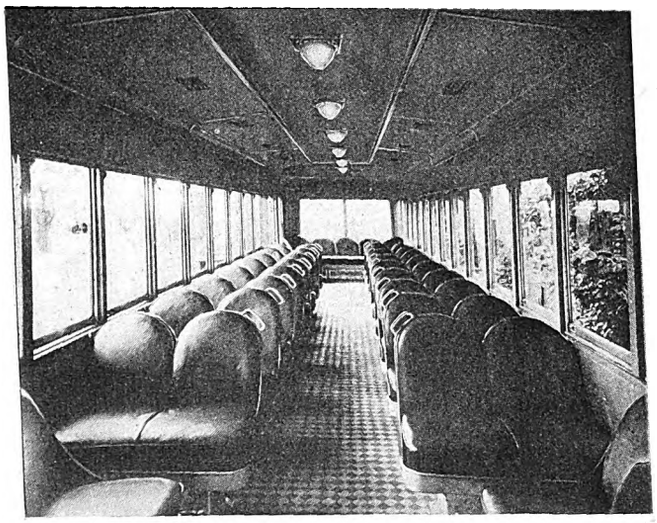
Digitized by Google

costs shows a reduction of $17,320 for eleven months in spite of the increased wages, and the gross earnings over the same period show an increase of $18,966. From this it would appear that the original estimate will not be far wrong in spite of the increase in labor costs. The one-man operation has resulted in a labor cost reduction of 2.46 cents per car-mile in an eleven-month period, a saving of 35.9 per cent after allowing for the increased rate of wages.

The average energy saving has been 20.3 per cent, due to the lighter weight of the cars. The average energy consumption per mile of the old type car was 2.76 kw.-hr., against 2.20 kw.-hr. for the new type.

Reductions in Maintenance Cost

After operating the cars for nearly a year it has been determined that there is a saving also in the maintenance of track, roadbed and equipment. There are no figures to show just what this saving is, but it is considered reasonable to place it at a minimum of 1 cent per mile. On the basis of the year's mileage this means an additional saving of more than $10,000. The actual saving in maintenance is not as yet available, but it is believed that it will be similar to that of other companies operating this type of equipment and that it will run close to 30 per cent. The net increase on the three items mentioned totals about $50,000 per year, which is a return of practically 30 per cent on the investment in the lighter equipment.



Floor and ceiling of car have been designed for beauty as well as wear

It is of interest that while the gross earnings of the interurban line were being increased to the extent of 6.06 per cent the Joliet city line suffered a loss of 1.22 per cent in earnings in the same period due to a decrease in operating revenue of $4,072.

With all these facts in mind it was felt that if such results could be obtained with a light type of steel car we might, by use of a lighter metal, obtain additional economies as to operating costs, and, as far as possible, additional revenue from traffic increase due to greater riding comfort and better service. We proceeded accordingly, during the past year, with two innovations from which we confidently expect further economies, based on our past experience. First is a new type of truck, using an automotive type axle with roller bearings, a differential and a worm drive. The second is an aluminum car body of our own design to be used with this type of truck. We expect also to use aluminum in truck construction, but this is to be worked out a little later.

The aluminum car body was shown at the electric railway convention in Cleveland. The new type trucks have been in operation on one car of the ordinary type since May 19 and the results have exceeded our expectations.

Features of the New Car

Briefly, the features introduced in this new design of a one-man, single-end car are: (1) Automotive type axle with differentials; (2) roller bearings and worm drive; (3) fixed truck bolster; (4) aluminum car body; (5) automatic heating through dynamic conversion of the wasted kinetic energy of car braking to heat energy within the car; (6) utilization of the heat energy of the starting resistor for car heating. These all make for more economical operation and more comfort. This particular car was designed for city service in Joliet, but there is no reason why it could not be used for interurban service if the speed ratios were stepped up and several other minor changes were worked into the design.

The semi-floating type of axle has its bearings located directly over the tread of the wheels. The axle housing completely incloses these bearings. The use of differentials eliminates slippage of wheels on curves and the worm drive permits use of a motor of high speed with a single gear reduction, thereby affording a large reduction in weight as compared with a standard railway motor of equal power rating. This weight reduction is strikingly borne out by consideration of the following figures:

Type Truck	Motor Rating, Horsepower	Motor Weight, Pounds
Automotive	28	410
Former (common type)	25	1,000 with gears, approx.
Former (used on light-type steel cars)	35	1,500 with gears, approx.

Two motors are carried on each of the two trucks. They are connected by means of a driveshaft and two universal joints through the worm drive to the axle with an $8\frac{1}{2}:1$ ratio. Instead of the customary floating type, a fixed bolster is attached rigidly to the side frame. It depends for flexure entirely on the long, semi-elliptic springs, underslung from the axles and attached to the truck side frame by shock-insulating rubber blocks.

The trucks are attached to the car body by an interlocking center bearing without a kingpin. A rubber pad is inserted between the center bearing and the body bolster. Rubber pads are also used between the side bearing plates on the car and the truck frame. These rubber pads, together with the rubber spring supports, all tend to absorb vibration and prevent its being conveyed to the car body. The 26-in. wheels are of rolled steel, held on tapered axles by a large nut and key. A rubber cushion between the tires and hubs of these wheels is designed further to eliminate noise.

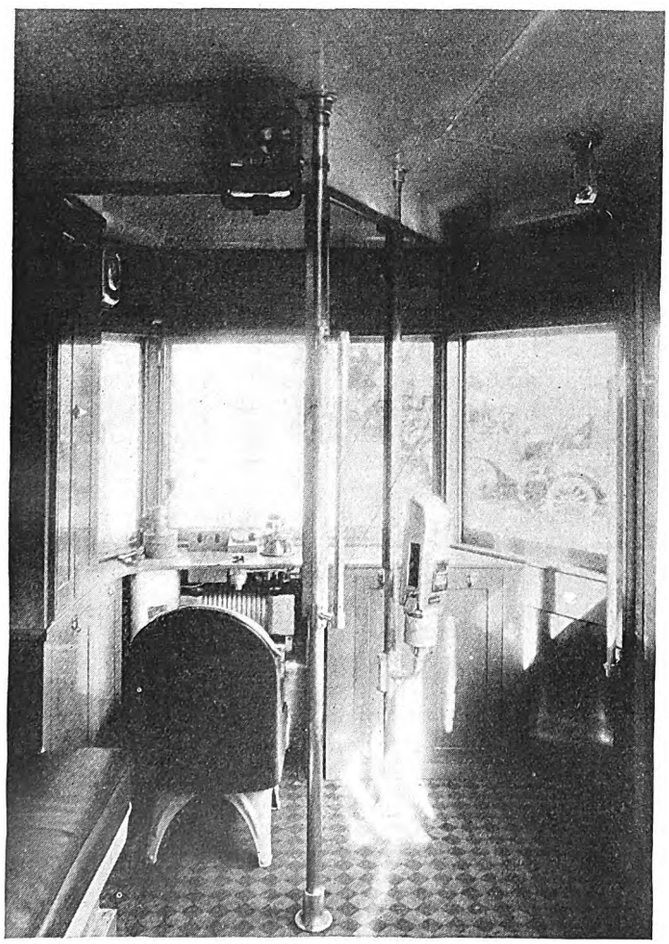
The drum brakes, of the air-operated, internal-expansion type, have a diameter of $17\frac{1}{4}$ in. They are mounted inside the wheels and are operated by a diaphragm on each axle housing. Each brake has four shoes of a special composition used on this type of equipment for the first time. Air is conducted to the diaphragms by $\frac{3}{8}$-in. tubing with flexible connections between tubing on the car body and that on the trucks. Use of this type eliminates all brake levers, links and toggles. The special composition used eliminates the familiar squealing of brakes. Experience to date shows a much longer life for

Digitized by Google

the new type of brakeshoe. The old type was good for 5,000 miles and needed many adjustments during that time. The new ones on the trucks in use have been run 10,000 miles with no adjustments and the indication is that their life will be from 30,000 to 40,000 miles.

Complete support of the motors on the truck frame, which is in turn supported on the long semi-elliptical springs, is expected to result in a material reduction in motor maintenance cost. The construction used has practically eliminated all the inherent noises of street car trucks and brake rigging. The new rubber-cushioned wheels have eliminated the ringing noise of the wheels on the rails and have made the car as void of noise as a modern automobile operating on good pavement.

What is believed to be an innovation in heating systems is the conversion of kinetic energy from braking the car into heat energy, together with energy loss from the starting resistors. There will be a supplementary set of

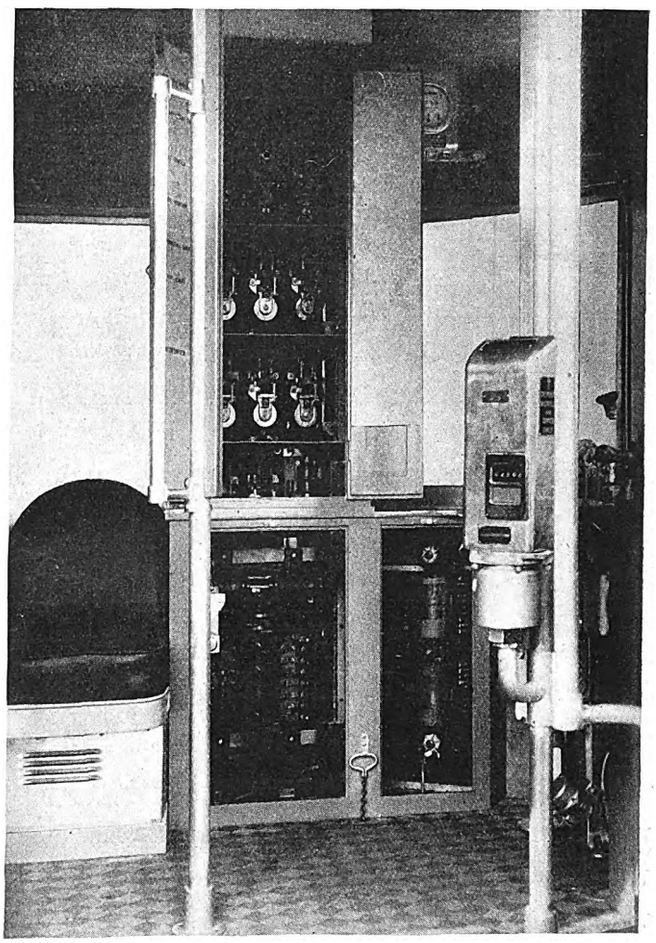


Control equipment is all located in the front vestibule

ten 500-watt heaters of the ordinary type as a reserve system.

No failure has been experienced to date with the light-type truck. The gears, axles and bearings were examined thoroughly at the end of 6,000 miles, but no perceptible wear was found. The manufacturer, basing his statement on these facts, estimates that the life of these parts may well be 1,000,000 miles.

Power tests on this type of truck in comparison with one of the old type, both used with the 22,000-lb. city-type bodies, show that the coasting qualities are 10½ per cent better. Accelerating characteristics are 25 per cent better with a total motor capacity of 112 hp. than for a car with the old trucks having a total motor capacity of 120 hp. The maximum service braking rate is 11 per cent higher. The free running speed is 12 per cent higher. With the new aluminum car body we expect that this increase will range from 30 to 40 per cent higher than with ordinary trucks and bodies. We likewise expect



Cabinets for equipment parts give neat appearance

the acceleration and braking rates to be increased, as the new body will weigh 10,600 lb. as against the present body weight of 22,000 lb. Until tests can be run no energy savings can be determined accurately, but we believe we are conservative in expecting at least a 20 per cent saving in this item.

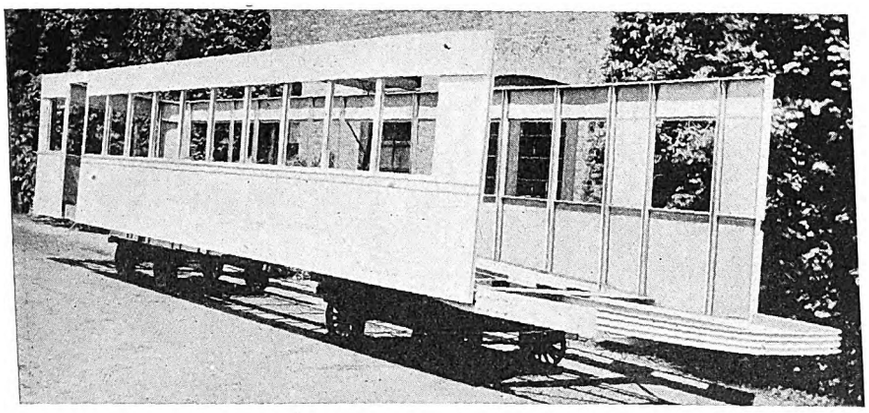
The Body Is Made of Aluminum

The new aluminum body is of the single-end type with a front door opening wide enough for both entrance and exit. There is a treadle-operated rear door for exit only. The step-well was eliminated, without increasing step height, by use of double folding steps at both ends, giving steps of 10¾ in. and 11⅞ in., respectively. The control equipment is all located in the front vestibule in the least fatiguing position for the operator.

Both ceiling and floor of the car have been designed for beauty and wear as well as for comfort. The vestibule ceiling is of sheet aluminum and the interior below the window sill is lined with heat-treated notched sheet aluminum. In the body itself aluminum alloy castings are used for condulets, drawbar anchorages, heater casings and door engines. Aluminum alloy plate, sheet pressings

Digitized by Google

and structural shapes are used in the construction of cable boxes, lighting fixtures, drawbars, ventilators, trolley base, trolley pole and harp, headlining, trolley retriever, window guards, destination signs, underframe bolster, anti-climber bumpers, step-treads and doors. Wherever strength is required the aluminum is heat-treated, giving it the same properties as structural steel. The only structural steel used is on the two outside platform sills at the entrance and exit doors, to which the step supports are fastened. There was no standard aluminum section heavy enough for these parts, so steel was used to save making special pieces. Aside from this the body frame is aluminum throughout. Seat frames and pedestals are also of aluminum and are of special design.



Except for two outside platform sills, car body frame is of aluminum

Genuine green leather upholstery is used. The seating capacity is 50.

Some of the principal car weights are as follows:

	Pounds
Weight of body complete with seats and accessories	10,410
Weight of trucks without motors	9,012
Weight of electrical equipment, including motors and heaters	3,600
Weight of air braking equipment and piping	700
Total	23,722

The weight per seated passenger is 474.4 lb., as against approximately 900 lb. with the present type car. An idea of the savings in weight over corresponding steel parts can be had from the following:

	Reduced		Reduction,	
	From, Lb.	To, Lb.	Lb.	Per Cent
Frame	7,000	2,600	4,500	63
Miscellaneous parts	....	....	2,000	..
Body	22,000	10,410	11,590	53
Air brake system	2,000	700	1,300	65

We found the cost of the aluminum car high due to the fact that most of the castings and specialties had to be made up for this job alone, entailing also additional pattern costs in some cases. An instance of this is a coupler casting which cost $59 in addition to a pattern cost of $60. Another is the price paid for special machine bolts. In steel the ⅜-in. x 2-in. size costs about 1 cent each; in aluminum these cost $2 each. Material for steel fenders made up in our own shop costs about $5, as against $35 for aluminum. These costs will hardly be overcome by savings in operating expense resulting from the use of aluminum parts, but the savings will, of necessity, remain in doubt until operating experience has indicated the amount by which repairs are reduced through the use of the aluminum parts. It should be borne in mind, however, that prices for aluminum castings and other specialties will be decreased materially when aluminum cars are built on a production basis.

Economies Justify Costs

The additional cost of the frame is amply justified by the operating economies effected. The 2,600-lb. aluminum frame cost $1,600, as against about $300 for a 7,100-lb. steel frame. This represents a saving in weight of 4,500 lb. We figure that our haulage cost covering power, maintenance, etc., amounts to 5 cents per pound per year. A saving of $225 is thus made each year on this item alone, enough to pay the additional cost of aluminum in about six years. Thus the additional cost for aluminum is amply justified.

Other advantages of aluminum are that it has less tendency than steel to rust and corrode and that wrecked or obsolete equipment will have greater salvage value as compared with steel. Lighter equipment, of course, needs a better conditioned roadbed to have riding qualities equal to those of heavy equipment. We feel that our experience justifies us in stating that, having put our roadbed in condition to handle the lighter cars satisfactorily, our maintenance costs will be less now than formerly, due to decreased wear. This will, we believe, more than offset the cost of putting the roadbed in the required condition. The advent of the one-man type of car also brings with it increased safety, due to control being centered in one man instead of being divided between an operator and a conductor.

We cannot as yet show any definite results, but we believe that we will have valuable experience with our new type trucks after they have traveled 100,000 miles and with our new aluminum car after it has passed through a period of active service. We feel that we are on the right course and that our hopes will be fulfilled Light-weight equipment has shown itself successful in improving interurban line service and increasing profits from it. There is no reason to believe that the aluminum equipment will not go further in this respect.

We will do no further experimental work this year, but if the car proves the success we think it will be it is probable that we will build more like it.

New Jersey Stockholders on the Increase

DURING the six months ended June 30, 1927, a total of 10,570 new names was added to the stockholders' list of the Public Service Corporation of New Jersey. As a result of this gain the company had on its books June 30, 1927, 62,572 names covering all classes of stockholders, eliminating duplications where holders own either common and preferred or more than one class of preferred stock. The total of 62,572 individual stockholders reported on June 30 compared with total stockholders numbering 52,002 reported on Dec. 31, 1926.

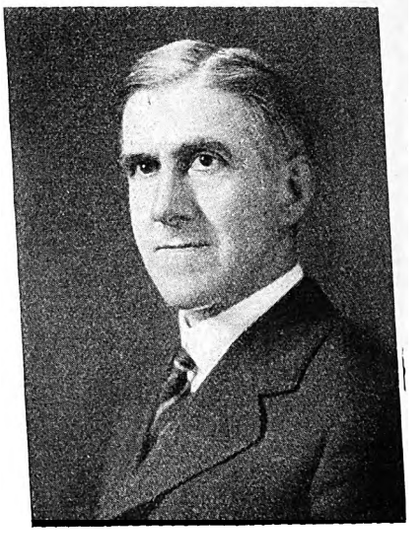
Wins the November Monthly Maintenance Prize

Means for straightening steel poles without removing them from the ground through the use of a simple fixture developed by the New York State Railways was awarded the $25 monthly prize for November in ELECTRIC RAILWAY JOURNAL'S *maintenance competition. A method of making up special work frogs for quick repairs received honorable mention. This was submitted by Louis T. Botto, superintendent of maintenance of way San Antonio Public Service Company, San Antonio, Tex.*



Harold E. Bean

TUBULAR steel trolley poles frequently are pulled out of alignment by loading or by the tension of trolley supporting span wires. Poles out of plumb present an unsightly appearance and also may pull the trolley wire itself out of alignment so that additional maintenance work is required at frequent intervals. To straighten the poles so as to keep up the appearance of the line, the New York State Railways uses a special fixture that provides a simple and cheap method for straightening a tubular steel pole. It can be used on any property without the necessity of removing the poles from the ground. A description of the fixture and its use was given in the Nov. 19 issue of ELECTRIC RAILWAY JOURNAL. It was submitted in the contest by Harold E. Bean, chief engineer of way and structures for the Syracuse lines of the New York State Railways.

A method of making up special work frogs for quick repairs submitted by Louis T. Botto, superintendent of maintenance of way San Antonio Public Service Company, San Antonio, Tex., was awarded honorable mention by the contest judges. This method of making up frogs for emergency replacement is quite ingenious. For a given blank center casting the range in frog angle is large and the cost of making such a frog should not be excessive. Frogs constructed as outlined in this article should have a life considerably in excess of that of an ordinary jump frog and should be much more satisfactory. Adequate strength is obtained through the use of acetylene welding.

The items selected for the November monthly prize and for honorable mention were two of the group of twelve published in the Nov. 19 issue. Items for the contest continue to come in and additional items appear in the following pages. One of these will be awarded the $25 monthly prize for December. Results of the contest each month are published in the issue of ELECTRIC RAILWAY JOURNAL devoted to maintenance and construction, which is the third issue each month.

The following gives a summary of conditions for submitting material in the contest. Complete details were published in ELECTRIC RAILWAY JOURNAL for April 16, pages 700-701.

1. Any employee of an electric railway or bus subsidiary may compete.

2. The author does not need to be the originator of the idea.

3. Articles may be submitted by several persons or by a department.

4. Any maintenance practice or device for electric railway or bus repairs may be the subject.

5. Articles should be 100 to 200 words long with one illustration, and in no event longer than 400 words with two illustrations.

6. Illustration material may be in the form of drawings, sketches, blueprints or photographs. All sheets should be marked "Maintenance Competition."

7. Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York.

8. A prize of $25 will be awarded each month for the best maintenance idea in the group published. A minimum of $5 will be paid for each article accepted for publication. Manuscripts will be received until April 30, 1928.

9. Announcement of the winner each month will be made in the issue devoted to maintenance and construction (the third issue each month) following the one containing the item.

10. Additional details were given in ELECTRIC RAILWAY JOURNAL for April 16, pages 700-701.

---

who was awarded the monthly prize for November in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest, is chief engineer of way and structures for the Syracuse lines of the New York State Railways. He has held this position since 1920, and for two years previous to that was assistant engineer of way and structures for these lines. Mr. Bean's electric railway experience began with the New York State Railways in Rochester in 1912 as mechanical draftsman. Two years later, after having served as building inspector on new construction, he was appointed superintendent in charge of underground circuits, and also had supervision of parks, return circuits and inside wiring. In 1917 he was made superintendent of distribution of the Rochester City lines of the company.

In his present position Mr. Bean has jurisdiction over all construction and maintenance of track, transmission lines, substations, d.c. distribution and buildings for the Syracuse lines of the New York State Railways. He has been very active in committee work of the American Electric Railway Engineering Association for several years, and has been a pioneer in the development of welding for manganese track construction.

BUSES AND TRUCKS—9

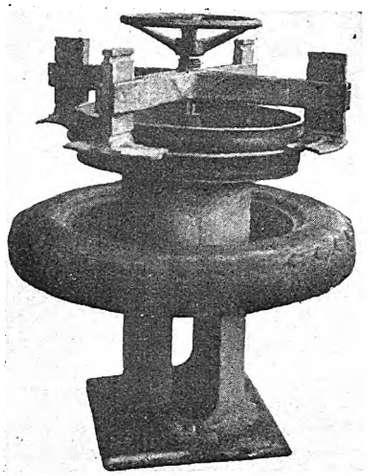
Machine Reduces Difficulty of Tire Changing*

By D. S. MacKay
Supervisor of Automotive Equipment Boston Elevated Railway, Boston, Mass.

NEARLY all of the 235 buses operated by the Boston Elevated Railway are equipped with solid disk wheels. Tire changing in connection with them is quite expensive. To decrease the labor required, the foreman of one of the bus garages devised the machine shown in the accompanying illustration.

A rugged, heavy, portable stand was constructed with a coarse threaded stud projecting upward. A spider with four radial arms slips onto this stud and a pressure shoe, arranged to engage the tires with lock rings, slides back and forth on each radial arm so as to accommodate any diameter of wheel. A threaded pressure wheel screws on to the stud above the spider so as to enable one man to apply great pressure to the tire or lock rings.

Some of the desirable results accomplished by this machine are that only one man is required and great physical force is not necessary, so that the job is made more pleasant. It is unnecessary to lift a wheel or tire from the floor since the machine is built to tilt at an angle of 30 deg., allowing the wheel to be threaded on to the stud. An even, steady pressure is exerted on the tire all the way around and there is no possible chance of injury to either the tire or wheel. Five tires can be changed in the time originally taken for one by the old method where tires were removed with a heavy hand hammer and tire tools. The machine is also used for pressing on new tires as well as for removing old ones.



Tire-changing machine used in the garages of the Boston Elevated Railway

Boring Axle Bearing and Housing Seats in a Wheel Lathe*

By Frank B. Carpenter
Master Mechanic Charleston Interurban Railroad, Charleston, W. Va.

WHEN the bearing fits in the motor frames and housings for armature and axle bearings become worn, it is the practice of the Charleston Interurban Railroad, Charleston, W. Va., to build the fits by welding and bore these out to the original size. This work is done on a wheel lathe by using a few 6-in. channel iron plates and four 8-in. screw jacks to attach and hold the motor shell in position. The boring bar and cutter head are made from an old car axle and a hub of a worn steel wheel.

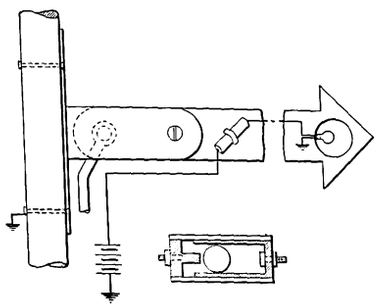
BUSES AND TRUCKS—10

Gravity Switch for Bus-Turn Signal*

BY FARRELL TIPTON
Electrician San Diego Electric Railway,
San Diego, Cal.

DUE to the construction of some of the modern passenger buses, it is impossible for the driver to give signals by hand. This makes a mechanical turn signal necessary. The accompanying illustration shows the arrangement used by the San Diego Electric Railway. The signal is controlled through a crank located adjacent to the operator. This is connected to a lever on the outside of the bus which controls the operation of the arm.

The signal arm is made of sheet metal, painted white. A lamp is located at the end of the arm and is inclosed by a red lens at the rear and a green lens at the front. This makes the position of the arm visible at night.



Gravity switch used to control lamps on bus-turn signal

To control the lamp a gravity switch has been devised to open and close the circuit by the action of the signal arm. The switch is made of fiber tube outside with a copper tube inside. Both ends of the switch are sealed. The cap on one end of the tube has a contact post projecting into the center of the sleeve. Electrical connection is made by a ball which is free to roll from one end of the tube to the other. Both ends of the switch are provided with terminals.

When the switch is installed on the signal arm, the switch is inclined at an angle so that with the arm extended the ball rolls into a position completing the lamp circuit from the side of the sleeve to the center contact post. The switch is connected to the positive side of the bus battery, the other side of the lamp and battery being grounded to complete the circuit.

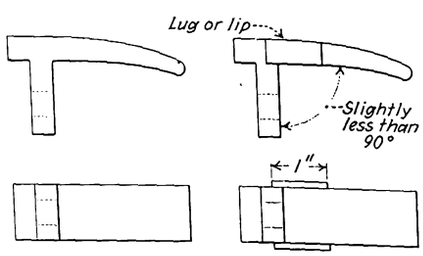
Keeping Line Breaker Arcing Tips Tight*

BY A. T. OLSEN
Omaha & Council Bluffs Street Railway, Omaha, Neb.

TROUBLE was experienced from DB-987 line breaker arcing tips coming loose in service, which usually resulted in tying up the car. As originally constructed, each tip is held in place by only one cap screw. The tips have a very narrow seat and eventually are loosened by the hammer blows of circuit closing.

To improve this condition, the Omaha & Council Bluffs Street Railway, Omaha, Neb., uses an arcing tip which has a lug or lip on either side. When forced firmly against its seat the hammer blows of the circuit closing do not loosen the tip. Except for these added lips, the arcing tips are identical with the manufacturer's product.



At left, old type of tip. At right, arcing top with lug to prevent loosening

The lips are 1 in. long and are welded onto the manufacturer's tip and filed to fit the seat. In order to insure that the tips seat firmly the part through which the cap screw passes is bent to an angle slightly less than 90 deg. As the cap screw it tightened the tip comes to a firm seat.

Convenient Type of Bench Clamp*

By Arthur E. Clegg
Foreman Electrical Department
San Diego Electric Railway, San Diego, Cal.

SAVING of time was the purpose that led to the design of a type of bench clamp used by the San Diego Electric Railway, which is shown in the accompanying illustration. Work can be held in the clamp firmly so that extreme accuracy will result and there is no wasting of time by the work slipping out of the clamp as in some other types.

The sections of the clamp designated as *A* and *C* are held on the end of the bench by means of wood screws. The movable part marked *B* slides along the beveled surface of *A*. The opposite side of *B* is parallel with the side of section *C*. The offset in *B* at the end provides for large objects. Very thin parts can be held by putting thin pieces along the surface of *C* and sliding the movable section *B* on the work, thus clamping it tightly.

TRACK AND WAY DEPARTMENT—14

Flange Bearing Electric Over Steam Railway Crossing*

By Louis T. Botto
Superintendent Maintenance of Way
San Antonio Public Service Company, San Antonio, Tex.

DURING the past year a special type of electric-steam railway crossing has been developed by the San Antonio Public Service Company. In this, the electric line is flange bearing over the steam line rails. This crossing is fabricated of 90-lb. A.R.A. rails, steel plates and two special steel castings which accommodate any angle between 50 and 90 deg. The framework holds the railroad rails securely to line and gage, but these castings are not bolted or fastened to the rails in any manner.

Since steel plates under the crossing are in the same plane, standard cross ties can be used at right angles to the railroad rails as in standard

Electro-Pneumatic Shear*

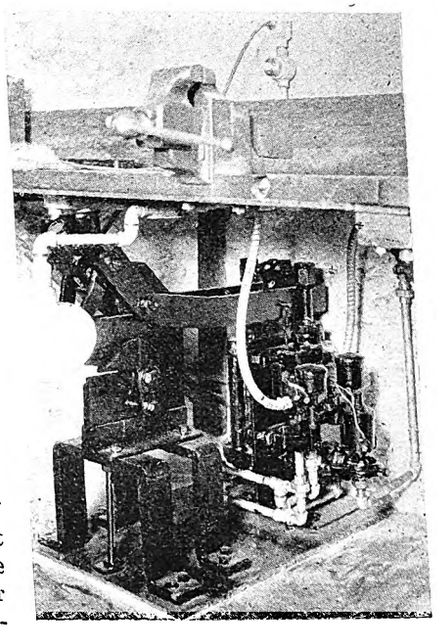
By A. D. Moore

Electrical Department, 69th Street Terminal,
Philadelphia Rapid Transit Company,
Philadelphia, Pa.

MANUAL operation of a shear with a capacity of ½-in. x 2-in. flat and ¾-in. round stock has been obviated by changing it for use with an air compressor in the shops of the Philadelphia Rapid Transit Company. A pair of obsolete pneumatic switch movement cylinders were mounted vertically on a bedplate together with the shears. The piston rods are connected with a yoke and power is transmitted from the cylinders to the shear through a lever with a 5 to 1 ratio. The lever consists of two bars with a common fulcrum tied together with a shaft which works in a bushing welded through the body of the shear. The connection between the lever bars and the piston yoke is made by means of a link. The original pin fastening the shear links with the manual lever was replaced by a shaft carrying a roller at each end. The lever bars are slotted and bear on these rollers, thus transmitting power to the shear blade.

Air to the apparatus is controlled by an electro-magnetic signal magnet valve. Directional control is by an electrically controlled National Pneumatic door engine valve which admits air to either end of cylinders.

In operating the shear the circuit is closed to the electro-magnetic valve. With the initial movement of the shears a holding circuit makes it unnecessary to continue to press the starting button. A circuit controller connected by links to the lever reverses a directional valve when the stroke is completed and returns the blade to its normal position. Provision is made to return the blade to its original position at any part of the down stroke as a safety feature.



Electro-pneumatic shear as constructed in the shops of the Philadelphia Rapid Transit Company

As the shear was placed beneath a bench for space economy, a swivel lamp is mounted for illumination.

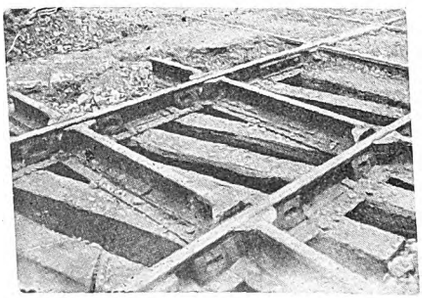
TRACK AND WAY DEPARTMENT—14

Flange Bearing Electric Over Steam Railway Crossing*—Continued

construction, and the steel plates provide better surface bearing on the ties. In paved street intersections where both steam roads and electric lines operate over double track, one set of crossings tends to creep in one direction and the other set in the opposite direction. This often causes a very unsightly and dangerous condition. With the type of crossing illustrated, such conditions do not occur.

In the construction of this crossing the arms of the electric part are perfectly flexible and form a kind of ball and socket joint with the railroad rails, which can be raised or lowered as conditions require. In paved city streets electric railways often are compelled to have crossings over the curves of steam roads, the outside rails of which are superelevated. Where such crossings occur the outside joints of the electric line usually cause an expensive maintenance job. With the type of crossing shown such conditions are accommodated very nicely.



Type of steam-electric crossing used by the San Antonio Public Service Company

During the past year nine of these crossings have been installed by the San Antonio Public Service Company. On an average they have cost much less than the crossings previously purchased and two welders with two helpers are able to fabricate a single crossing in three days.

REDUCE ROAD FAILURES

Road failures to a considerable degree are motor insulation failures.

These failures are greatly reduced by periodic renewals of the insulating varnish, which protects the car motor armature.

The renewal process requires but little time and no trouble when the maintenance shop is equipped with a specially designed insulation baking oven.

Armature baking is the best way to decrease road failures.

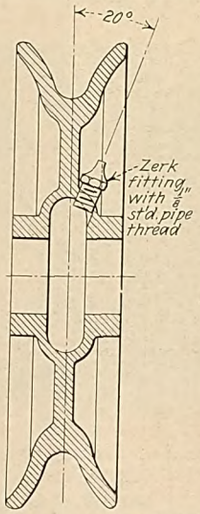
Grease Fittings Applied to Trolley Wheels*

By Charlie Herms
General Foreman San Diego Electric Railway, San Diego, Cal.

TROLLEY wheels lubricated by Zerk grease fittings are used by the San Diego Electric Railway. Wheels are ordered with a hole drilled and tapped for ⅛-in. standard pipe at such an angle as to permit the use of a Zerk grease gun nozzle. For a 6-in. diameter wheel an angle of 20 deg. is required to permit the placing of the gun nozzle between the harp and the flange of the wheel.

This method of lubrication shows that there is less bushing and pin renewals and less time is required on inspection for lubrication of trolley wheels than with methods previously used. The life of the trolley wheel itself is also increased as fewer wheels develop flat spots that are usually caused by sliding on account of poor lubrication. Zerk fittings are removed from old wheels and reinstalled in new ones.



Application of a Zerk fitting to 6-in. trolley wheel

With this method of lubrication the chamber of the trolley wheel is kept filled with grease and a wheel can make a 500-mile run without danger of running dry. Another advantage of the Zerk fitting over the old method is that grease or oil is not spattered over the ends of cars. Previously inspectors did not have a proper method of applying the lubricant and a considerable amount would be dropped on the cars and cause a bad appearance.

Dipping and Draining System for Field Coils*

By Equipment Department
Georgia Power Company

REINSULATION of field coils with the system used by the Georgia Power Company requires dipping in plastic varnish before and after the canvas webbing is put on and dipping in finishing varnish to provide a smooth, glossy finish after the last baking. Convenient equipment is provided for the dipping and baking in the form of a sheet metal trough 20 ft. long fastened to the shop wall. The trough is divided into two sections of equal length, each draining toward the center and emptying into different vats. One side is used for black plastic varnish and the other for air-drying finishing varnish. By dividing the trough the two operations can be taken care of without mixing the fluids.

Supports are provided for the field coils in the form of pegs welded

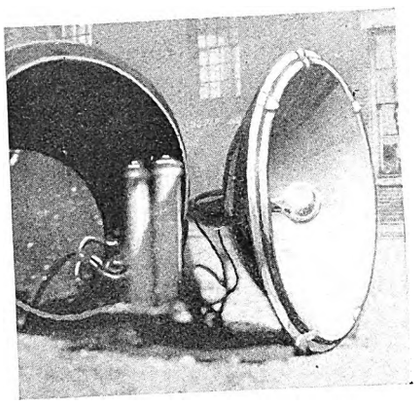
ROLLING STOCK—MISCELLANEOUS—19

Modernizing Headlights*

By R. T. Chiles
Master Mechanic Cumberland County Power & Light Company, Portland, Me.

IN ORDER to bring our headlight equipment to a higher degree of efficiency we were confronted with the alternative of junking 50 Imperial headlights and rewiring cars for use of a more modern type or the reconstructing of the present headlights. As the cost of new equipment and wiring changes would have been about $60 per car, it was decided to modernize the present headlights so as to use standard 150 or 95-watt concentrated filament lamps and a glass reflector with focusing arrangement.



Construction used for modernizing headlights

This was accomplished without changes to the car wiring, as in addition to the 210 ohms in the old headlight resistance we added 295 ohms in the circuit. This provided 60 volts for the dim stage, and by tapping the resistance in the headlight circuit at the 160-ohm point 115 volts was provided for the bright stage. The two resistance tubes in the headlight are mounted on the original bracket and, for the 150-watt lamps, are wound with No. 24 resistance wire.

For headlights using 94-watt lamps a resistance of 611 ohms was added in the headlight in addition to the old resistance for the dim stage to provide 60 volts and a tap was brought out to give 300 ohms and provide 115 volts for the bright stage. No. 29 resistance wire was used. Other material used to modernize the headlights included 12-in. glass reflectors, new sockets and a small amount of resistance wire. The labor cost was about $16 per headlight.

ROLLING STOCK—ELECTRICAL—33

Dipping and Draining System for Field Coils*—Continued

into a piece of $\frac{3}{8}$-in. x 3-in. steel which is fastened to the wall along the top edge of the back of the trough. The pegs are spaced 12 in. apart and with fields in position there is 1 in. clearance between them.

For convenient handling a small traveling hoist with a brake above the trough is arranged so that the lifting hook will remain in any position until the brake is released. One man can lift a field coil with the hoist and move it along the trough without danger of dropping it.

This system replaces one which required two men to handle coils from the dipping vat to the drain board. The old system required a floor space 8 ft. square. The new equipment is 20 ft. long, projects 18 in. from the wall and uses less than one-half the floor space of the previous equipment. It also presents a much neater appearance.

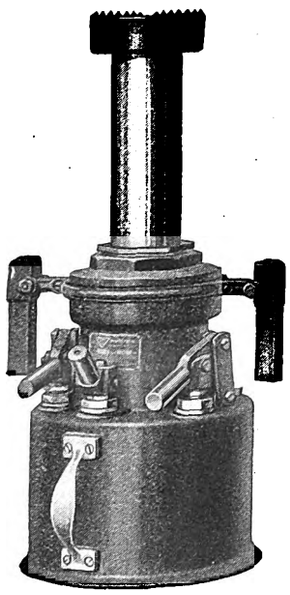
New Equipment Available

Light-Weight 75-Ton Jack

EXTENDING its line of oil power jacks, a 75-ton model hydraulic jack has been brought out by the Blackhawk Manufacturing Company, Milwaukee, Wis. This new model weighs but 200 lb. and is lighter than jacks of other design of similar capacity. It has special carrying handles so that two men can carry it with little effort.

The collapsed height of the new jack is but 18 in. and is low enough to go under most jobs. It has a 10-in. lift, which gives a total height of 28 in. There are two pumps, a speed pump to raise the plunger of



New 75-ton hydraulic jack

the jack to the point of contact and a power pump to raise the load.

The load is lowered automatically, fast or slow as desired, and is under control at all times. It can be raised or lowered in fractions of an inch, as desired. A release valve entirely separate from the pump prevents accidental lowering. All working parts are built on the outside of the jack.

An outstanding feature is the check valve unit. This contains both ball checks and is the heart of the jack. The twin check unit can be removed easily for cleaning by simply unscrewing the pump, without tearing down the jack. The capacity of the jack is rated conservatively, safety being the first consideration. Each jack is tested beyond rated capacity at the factory.

Dick Prescott Talks Colors

And Steve Sees the Light

DICK PRESCOTT, assistant superintendent of the Consolidated Railway & Light Company shop, had taken Steve White, carpenter shop foreman, out into the shop to look over one of their most modern cars. Steve did not know what Dick had in mind, and so he looked expectantly when they paused before a car.

"Steve," said Dick, as he pointed toward the Consolidated's latest type of rolling stock, "look at that car and tell me whether you would paint your automobile that way."

"I don't get you, Dick," replied Steve, regarding his superior in mild surprise.

"Sure you do, Steve. Would you paint the doors of your automobile a different color than the body, or would you slap a solid color of green or yellow or orange all over your automobile body and let it go at that?"

"Why, of course not."

"Then why in the world do we do that on a street car?"

"Well, a street car's a different proposition."

"Why, Steve?"

"Oh, I don't know, Dick. I don't quite get you yet. We've always painted cars that way."

"That's exactly what I'm driving at. We started painting cars that way long before the automobile came along, when people had to ride with us or walk, and we've never given a thought to doing anything else."

"What have you got in mind, Dick? Goin' to put on a lot of these circus colors we've been reading about?"

"Not at all."

"Then I don't quite follow you."

"Listen here a minute, Steve. It's amusing to hear some of the serious discussion of this circus painting by people who don't understand what it's all about. Some of the properties that have put on bright colors with pennants and other decorations have done that merely to attract attention to the fact that there's a street car system in town. That's merely a passing phase in the effort to develop more attractive color combinations for cars, and painting schemes that will improve their appearance instead of making them look awkward and clumsy."

"That sounds all right, Dick, but what do you propose doing?"

"I think we ought to get away from that solid yellow we've had on these cars for fifteen years. Let's use one of the automobile man's bag of tricks that we see paraded before our eyes every day and that he uses effectively every time he brings out a new model. We could pick out a decent combination of two colors that blend well together and put a nice band or stripe between them so we could carry the colors all the way around the car."

"Do you mean that you'd paint right across the doors instead of keeping them finished in mahogany?"

"Sure."

"Well, I never saw that tried. Still I can't see but what it would look all right."

"There's only one way to find out how to do it, Steve, and that's to try it out. Let's take this car as a sample and see what we can do."

"That is easy, Dick. I'll bring some color panels up to your office tomorrow, and you can decide on the color scheme you want to try out."

"Good enough. We may have to try two or three combinations before we work it out, but I'm anxious to see whether Mr. Milburn, our general manager, isn't ready to spend a little money on paint to make these cars look a little less like box cars going down the street."

Association Activities

New England Club Has Record Meeting

History of the Connecticut Company was outlined and New Bridgeport mercury-arc rectifier substation discussed before large gathering at Hartford

IN ACCORDANCE with its recently adopted policy of holding meetings in the various cities served by the larger operating companies in that section the New England Street Railway Club met on Dec. 8 at Hartford, Conn. The program was arranged by N. J. Scott, manager of the Hartford division of the Connecticut Company, and centered around the activities of that railway. About 200 members were present. This large attendance was said to establish a record for a regular quarterly meeting of the club.

Charles Rufus Harte, construction engineer of the Connecticut Company, presented an interesting outline of the 68 years history of his company and its predecessors serving the same territory. His talk was illustrated by lantern slides showing both the early days of the railway's history and the scope and character of its present transportation system. An abstract of his address appears elsewhere in this issue.

Rectifiers Supply Bridgeport

Mercury-arc rectifiers at the new Bridgeport substation were discussed by George Wood, power engineer the Connecticut Company. Early in the fall of 1926 studies had been commenced, he said, with a view to the creation of modern power facilities for the company at Bridgeport. The company's Seaview Avenue generating station was old and costly to operate. Its location was remote from the center of the load and there were considerable losses in the feeder lines. Another influential factor in favor of change of the source of power was the impending necessity to spend $60,000 for a new submarine cable crossing where the city was planning to relocate an important highway bridge. These studies indicated that the power demand of the railway could be met most satisfactorily by the erection of one substation in the vicinity of the Congress Street carhouse in the city of Bridgeport and a second in the town of Stratford.

Mercury-arc rectifiers were chosen for these substations for four reasons: (1) Efficiency; (2) ability to operate on either 25 or 60 cycles; (3) low maintenance cost; (4) freedom from heavy foundation requirements. The latter consideration was of great importance because the station is located on filled land. Accordingly seven 2,000-amp., 600-volt mercury-arc rectifiers were bought from the American Brown Boveri Corporation. The Congress Street substation, which carries the bulk of the load, is equipped with five rectifiers. It is manually operated. The Stratford substation has two rectifiers and is wholly automatic. For convenience and simplicity it was decided that all units at both stations should be of the same design.

Mr. Wood presented lantern slides showing the outdoor equipment, including the two incoming three-phase, 13,900-volt transmission lines, the auxiliary bus on each line ahead of the switches, the auto-transformers and the main 1,400-kva. transformers. These are designed to operate with three-phase primary at 6,600, 11,000 or 13,900 volts, while the secondary is double six-phase at 550 volts.

Other views were presented showing the interior equipment and arrangement of the station. The rectifier and feeder control board consists of twenty panels. At one end is the incoming line and auxiliary control panel. Next come five rectifier control panels with meters and protective apparatus. At the other end of the board are fourteen panels for feeder switches and circuit breakers.

Construction of the building was commenced March 27 of the present year, Mr. Wood said. Work on the equipment began May 15. The first unit was put in operation Aug. 15 and all were in operation by Sept. 26. No trouble of any kind has been experienced since these rectifiers have been in service and an over-all efficiency of 93 per cent has been obtained, including the line loss. A technical article concerning this installation will appear in a future issue.

The discussion was continued by John Egli, field engineer American Brown Boveri Corporation. He said that the reason for installing auto-transformers was to permit the station to operate at a greater variety of voltages than could be secured satisfactorily with ordinary transformers. He called attention to the fact that more than 800 mercury-arc rectifiers have been made by the Brown-Boveri company at Baden, Switzerland, and that street railway systems at Berlin, Germany, have placed orders for additional equipment.

Robert B. Stearns, president of the club, presided at the dinner and evening meeting. He paid tribute to the excellent work done by the officials of the Connecticut Company in arranging the meeting. J. K. Punderford, president of the company, said that the major part of the credit belonged to N. J. Scott, manager of the Hartford division. The latter spoke briefly and said that it had been a pleasure for the Connecticut men at Hartford to do what they could in arranging the program and making the meeting a success.

Transportation problems were touched upon briefly at the end of a talk by Richard T. Higgins, chairman Connecticut Public Utilities Commission. Mr. Higgins began his talk by mentioning the annual meeting of the National Association of Railroad and Utilities Commissioners held some time ago at Dallas, Tex. From this he went on to speak of industrial conditions in the South. Reverting to the subject of transportation, he said that the public will co-operate if informed of utility activities. Good service and courtesy, however, are essential to securing this co-operation. In Connecticut the commission's inspections showed the bus service rendered by the Connecticut Company to be the best in the state. This, he said, is primarily because it has trained men. He prophesied an increasing use of public transportation vehicles because congestion is causing people to keep their private automobiles at home. Nothing has yet been invented, he said, which equals the street car for efficient handling of mass transportation.

COMING MEETINGS OF *Electric Railway and Allied Associations*

68 Years of Railway Service in Connecticut*

By Charles Rufus Harte
Construction Engineer the Connecticut Company, New Haven, Conn.

HISTORICALLY, the Connecticut Company dates from June 18, 1859, when its oldest line, the Hartford & Wethersfield Horse Railway, received its charter. Other lines followed from time to time until 1888. When electric operation began, there was a very considerable mileage throughout the state.

The New York, New Haven & Hartford Railroad made its first purchase of trolley stock, a controlling interest in the Stamford Railway, in 1895, but the principal growth followed the purchase, in 1902, of the Worcester & Connecticut Eastern, which under its new name of the Consolidated Railway, by purchase, construction and lease in the period ended June 1, 1907, created practically the present property, which on that date was put into the hands of the Connecticut Company, chartered for that purpose, to be operated by it. In 1910 the title to the property formally passed to this company.

In 1914, in connection with settlement of difficulties with the United States government, the Connecticut Company was placed in the hands of five federal trustees, appointed by the court, a situation which continued until Jan. 1, 1926, when the decree was dissolved and the property was returned to the New Haven Railroad.

The system consists today of 514 miles of first main track, 185 of which is double, and 196 miles of bus routes, over which are operated some 1,323 passenger cars and 124 buses. These carried in the twelve months ending Oct. 31, 1927, the equivalent of 151,030,148 single fare, and 29,334,383 transfer passengers by cars, and 13,334,383 single fare and 1,821,545 transfer passengers by bus, the necessary power for the cars being in part generated by the three owned stations at New Haven, Hartford and Danielson, and in part purchased.

It was the thought of the late president of the New Haven system, Charles S. Mellen, that the way to make a railroad prosperous was to insure the prosperity of its territory, and he believed that good secondary transportation would bring that prosperity, resulting in a net gain if both groups were under the same control, although the secondary group by itself might actually be a losing proposition. The difficulties of the New Haven and the astounding increase in automobile use completely upset Mr. Mellen's calculations, but any criticism of the unfortunate outcome of some of the plans, to be just, must consider the purpose in view, and the totally unexpected development of later years.

The track structure today does not include any of the old strap rail on longitudinal stringers, nor some of the very light sections on metal chains, but while in replacement general standardization is going on there is still a large variety, partly hand-me-downs from old companies, but still having good service life, partly as the result of experimental work and partly due to special conditions. Today we have three general forms, open steam railroad type on private way, paved on wooden ties in the majority of the cities, and here in Hartford, where clay makes a great deal of trouble, paved on steel-and-concrete twin ties on a concrete mat with upturned edges, forming a trough.

These ties are precast, the increased weight making it far easier to line and surface the 134-lb. rail under which they are used, while their shorter length and less depth than wood ties effect a saving in the expensive mat construction that offsets the higher first cost. Joints are welded, using chiefly the arc, although there have been quite a few thermit welds. General maintenance costs have been steadily reduced by the employment as far as practicable, of the modern mechanical aids, ranging from cranes and steam shovels down to tamping tools and similar compressed air apparatus. It may be of interest to note that Con-

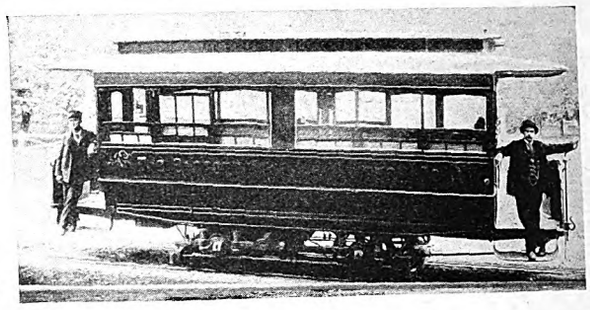
An early model of car for the Hartford & Wethersfield Horse Railway



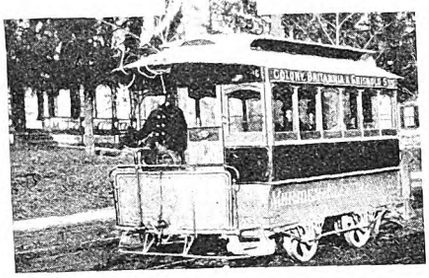
This car was placed in service in Hartford during 1890

necticut, recognizing the injustice of today requiring the trolley to pave a large proportion of the street for the use of its competitors, has cut down the paving requirement for the old one of all between lines two feet outside the outside rails, to eight inches each side of each rail.

The early motive power was that of the good old "hay burner," not unduly speedy, but reasonably dependable if conditions were not too adverse. The old track and the small flanges made a combination easily broken up, and it was regular procedure to turn the team to one side, drag the car off the rail, around some obstacle and back on to the track, which was apt to be pretty nearly as rough riding as the cobble paving.

The advantage of a different type of motor was early realized, however. In 1873 New Haven tried a compressed air motor which went out Whitney Avenue quite successfully, but came to grief in returning. A number of the properties were deeply interested in the developments in electrification, so much so that while the first successful commercial line, the Sprague system at Richmond, Va., began operation in February, 1888, Connecticut had three electrified systems in operation within eight months.

At Derby, a Van Depoele system started operation on May 1, 1888. The little cars had the motor on the front platform with chain-and-sprocket drive to the axle, and the collector was an underrunning wheel. James Kennedy, now roadmaster of the Derby division, had much to do with the installation and claims to have invented the first overhead frog. His description of how he made the pattern from the heavy pasteboard of the box which held his wife's wedding dress, and of the lady's reaction when she discovered it, is certainly convincing.



A Daft car at Meriden, using an over-running collector

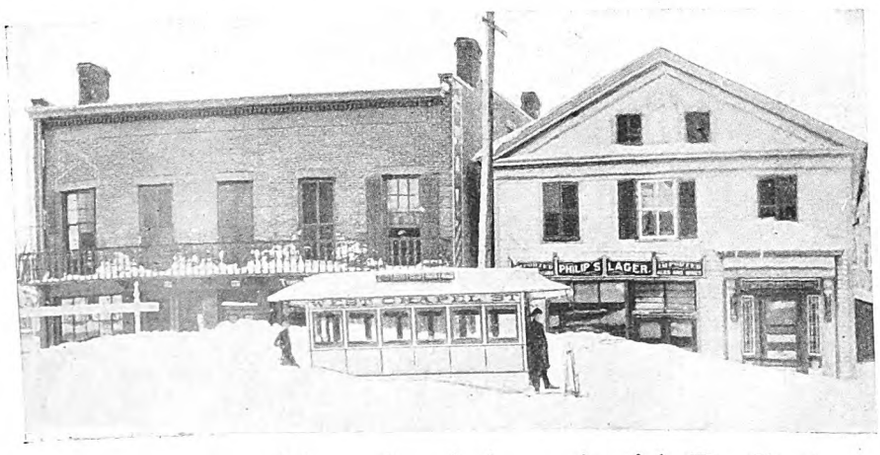
On July 1, 1888, Derby put in operation a Van Depoele freight locomotive, and while in the earlier experiments electric locomotives had been used to draw passenger trailers, so far as is known this was the first use of an electric locomotive for freight service in the world.

In Meriden, two months later, there was started a Daft system, using the overrunning collector, a real trolley, which gave the electric car its usual name. The two sides of the circuit formed the track for the collector, from which a flexible cable dropped to the car where it was so fastened that it could readly be disconnected. There were but the two wires overhead, and at sidings, while the cars passed, the trolleys were exchanged. The device proved a bad actor, however, readily running off its wire track, smashing in the roof of the car when, as was usually the case, it landed there.

Hartford had been the first city in the state to have horse cars, and while it was a little slow in trying the new electric cars it was not very far behind Derby and Meriden, its Sprague system having a tryout on Sept. 12, 1888. The car looked more like a present-day trolley than the two others, and it worked well, but it was some time before all the city lines were electrified. During this period, about 1890, there was tried a Barrett storage battery car, made in Springfield, which ran for some time with varying success on Main Street.

New Haven held to the horse car even longer than Hartford. The first line electrified was that to West Haven, the first electric operation being the night of June 13, 1892; the last line the Dixwell Avenue, was electrified three years later.

Appreciating the possibilities of the bus, this company early gave the question careful study, but it was not until the Legislature of 1921 gave some measure of protection that regular operation was tried. Today we have a fleet of 124, furnishing transportation in those cases where there is a real necessity, but not enough to warrant construction of a car line; where highway changes required track reconstruction at cost which was not warranted by the traffic; and in a few instances where it has been possible by the use of the bus to give express service, notably in the case of the New Haven-Bridgeport line.



Snowbound. One of the experiences in the operation of the West Chapel Street line in New Haven

British Institute President Shows Economy of Electrification

R. T. SMITH, the new president of the British Institute of Transport, in his opening address delivered in London recently spoke on "The Advantages of Main-Line Railway Electrification." He drew attention to the results of six years' operation of the electrified portions of the Swiss Federal Railways. President Smith said that the time of the journeys made by express trains has been decreased 20 per cent and slower passenger services have been improved. Heavier freight trains are being hauled than was possible with steam locomotives, the average increase in trailing load up to last August being 47 per cent. The capacity of the Gothard line for carrying minerals has been doubled.

Electrification has not increased the cost of the permanent way. Together with the fall in the cost of wages, it has reduced the total cost of traction and of workshops, and has enabled 34 per cent more traffic in ton-miles to be hauled by the whole railway equipment, steam and electric, in the last four years without any appreciable increase in the traffic cost of working the trains and the stations.

Relative to English and Welsh railways, Mr. Smith said that the individual headings of expense in the working cost of the train-mile since the war average three times the pre-war cost, but will probably sink to double pre-war cost. Estimates for main-line electrification projects in Britain over long lengths of route show that the savings in working expenditure as compared with steam will pay on the cost of electrification from 5 per cent on fairly busy lines to as much as 12 per cent on lines fully worked with dense mineral and freight traffic throughout the 24 hours. The capital cost per route-mile of double track, estimated at £25,000 ($125,000) for suburban lines, will probably amount to £60,000 ($300,000) for main lines.

English and Swiss figures are not comparable, as English equipment is for density of traffic between two and three times as great as Swiss traffic. Speaking as an engineer, one-half of whose career has been spent in the railway service, President Smith said that perhaps some of his old railway colleagues would be stimulated to look at railway electrification not only from the point of view of saving working costs—although this can be done under favorable conditions—but that of increasing the earning power of a certain investment in way and works through increasing the average speed of freight train and slow train operation.

Co-ordinating All Transportation Facilities Under One Management*

By J. M. Shaw
Executive Secretary Mitten Management, Inc.

IT HAS come to be recognized in modern business that mankind withholds its greatest rewards for those who serve it best. It is the recognition of this truth which has changed completely in two short decades the public attitude toward "big business." The modern trend is all toward consolidation of related industries and industrial units. We gaze with mute approval at consolidations and mergers which fifteen years ago would have made us rush wild-eyed from the market place determined to pass a law.

We have seen the trend toward consolidation in our own industry and it is universally agreed that we need more of it. The problem facing our largest cities is how to bring it about fully and completely and in fairness to all.

The street car is now and is likely to continue to be the backbone of transportation in large cities. The motor bus has found a place of increasing usefulness in supplying boulevard service and in serving feeder lines in outlying sections, as well as in communities where the large initial investment in track and overhead is not justified. High-speed lines under and over the ground have contributed much in densely populated cities. The private automobile has won the hearts of many who formerly use public transportation. All of these facilities, however, have limitations which prevent them from replacing the street car.

Mitten Management, which operates the city transportation systems of Philadelphia and Buffalo, has arrived at the conclusion that every phase of city transportation must be brought under one direct operating control before this universal problem can be properly approached. By this means street space may be conserved. At the same time, the largest possible proportion of transportation earnings may be made available for expansion and improvement.

This principle has been applied in Philadelphia to a greater extent than in any other large city. The street railway lines have for many years been operated as a unit by the Philadelphia Rapid Transit Company, the numerous companies of earlier days having been brought together by the economic pressure of the need for a one-fare city-wide system. To this surface system have also been added the Market Street subway-elevated line, built by the company, and the Frankford elevated line, built by the city.

The development of the motor bus, because of the urge to "ride on rubber" and in view of the advance in the automotive art, was inevitable. We were confronted with the problem of meeting a new form of competition with the street railway lines. Decidedly the best way to meet this competition would be to use the resources of the existing system to develop a bus service which no competitor could hope to equal. Since 1923 we have steadily added to our bus equipment and are now operating buses over 200 miles of city streets at a 10-cent fare, assuming a seat for every passenger, and giving a connecting ride with street car and subway-elevated lines for 3 cents additional.

Even the motor bus, however, does not entirely meet the public desire for greater speed and comfort, and the taxicab in recent years has become increasingly a factor of competition with the existing facilities. P.R.T. accordingly purchased the Yellow Cab Company, the largest cab operator in Philadelphia, and has announced its intention of ultimately combining as part of its system all the taxicabs of the city. When this is accomplished, it will make possible the furnishing of a higher grade of service, with elimination of unnecessary cruising in the city streets and other economies.

The Philadelphia taxicab companies have submitted to the Public Service Commission a plan for the elimination of cruising. Under this plan the two smaller companies will be merged with P. R. T., leaving only two companies in the field. These will co-operate in the no-cruising plan. The cabs will thus operate so as to increase their own usefulness and at the same time give due consideration to the economical use of the street space in the interest of the great majority.

Not only does this co-ordination wipe out the wastes of competition and make for better transportation service, but it has the added advantage of keeping together in one fund the earnings of the joint system, so that as little as possible may be dissipated and the greatest possible share applied to help support new facilities supplied either by the company or by the city.

This entire transportation problem is vital to the future of every American city, and the one which solves it best will have a great commercial advantage over its less progressive neighbors.

From the standpoint of the private operator, there must be a readiness to submit to the process which transforms him from a street railway man, a bus man or a taxicab man to a purveyor of transportation. He must understand that, although his business has thus been co-ordinated with others, he is subject to more violent competition than ever before because of the development of the private automobile. He will be wise if he has his ear to the ground to recognize changes in the public taste, and by supplying every need win that measure of public good will which is priceless and the importance of which we have in the past been inclined to minimize. Our slogan for the future should be "Co-ordinate or bust."

Better Organized Supervision*

By W. T. Rossell
General Manager Pittsburgh Railways

TO ORGANIZE is by definition to bring into systematic relation as parts of a whole. Electric railway properties are organized to produce local mass transportation of the best quality consistent with a low fare and a reasonable profit. Organization connotes supervision. A lone craftsman or artist, fashioning a completed article, needs no outside supervision. He is a complete organization in himself. At first, men were individualists, each supplying his own needs. The family and the tribe were the first steps in specialization. The history of civilization is the history of specialization.

To be successful, an organization must perform its functions well as measured by the standards of the day. It must also have the power to adjust and to adapt itself to changed conditions. Nothing is surer or more ruthless than change. Its victims strew the records of the past and are everywhere today. They include every kind of organization, from individuals to empires. So the value of an organization may be measured by the two qualities efficiency and adaptability. They are not synonymous, indeed they may be mutually exclusive.

Industry developed as men gradually discovered that by gathering in organizations they could produce and consequently have more. It was discovered that tools could be used to advantage; that one man could do one part of the work and others different parts. Some came to supply the materials; others to fabricate them.

These methods grew slowly, painfully, and often in a haphazard way. It was at times discovered that materials moved back and forth many times before the work was completed. Men frequently spent more time walking about than they did at work.

It must be obvious to all that as specialization increases the interdependence of individuals and groups grows. Some one fails and another finds himself without the proper tools or materials. His failure in turn reacts on others and the whole organization is affected. Whether the organization be a shop, a department or an entire street railway company, the better it is organized the greater the specialization.

Here is often a weakness of large organizations. They become unwieldy, there is a lack of co-ordination between the parts. This may develop into misunderstanding and even jealousy or hostility. This is by no means an uncommon condition in industry. We all have seen it. Here is the rôle of supervision. Its part is to clear the path; to study the problems; to bring out the facts.

The work as a whole must be coordinated and information must be disseminated throughout the organization. Obstacles must be removed, emergencies must be foreseen and plans must be formulated. In general, supervision performs the same functions for industry that the brain and nervous system do for the human being. The careful organization of supervision is nothing but the logical carrying further the idea of specialization.

"Organize, Deputize, Supervise"

When this is understood the further division of duties is simplified. In general, supervision divides itself naturally into three parts, which must be present whatever the size, organization, or type of work. The first includes research, planning, emergency and other things which do not come under the head of regular routine.

The second includes supplies, records and other matters that might be called auxiliary routine. The third includes the supervision of operations, the daily routine of the organizations. Each of these parts may comprise a considerable organization or they may all be included within one man; the natural division still remains.

There is often a tendency to have too little supervision. Its value is at times intangible and retrenchment is easily made by cutting the supervisory force. In a well-trained organization the loss may not at first be felt. Later, the organization may show a let-down, both in efficiency and in adaptability.

It is difficult to know the right organization. The only true measure we have is economic, and complete analysis is difficult. If we can lay our natural prejudices aside, and, over a considerable period of time, note a steady, uninterrupted, forward progress it is reasonable to believe that our supervision is well organized. This is especially true inasmuch as overmanning is almost as hurtful as undermanning. Someone has given as a formula for management: "Organize, deputize, supervise." To state it better would be difficult.

**Abstract of a paper presented at the annual convention of the Pennsylvania Street Railway Association held at Scranton, Pa., Dec. 1 and 2.*

Unselfish Co-operation Needed to Solve Traffic Problem*

By R. C. Haldeman
President Pennsylvania Motor Federation

NO ONE has yet, nor in my opinion will any one for some time, bring forth a complete solution of the present-day traffic problem. Many excellent ideas have been proposed and, conversely, many that are not worth the ink necessary to put them on paper. This will always be, so long as human nature is such that it views things from the individual standpoint and not strictly for the advantage of the greatest number.

The present-day habit of using our streets as a public garage is one of the greatest evils tending to increase congestion in the business districts of our municipalities. It is both a selfish and a time-wasting habit of the motor car owner. The individual apparently gives no thought to the inconvience that his action places on the many. It is a simple mathematical proposition to determine how many automobiles can be parked in one block. It is also comparatively simple to count the flow of vehicles through that block. Statistics show that the number of flowing vehicles overbalances those parked in the ratio of more than 7,000 to one. Need anything more be said on the question of selfishness?

But if the individual still insists on being selfish, let him consider the time that he is wasting. It averages at least ten minutes to get the car out of a garage in the morning. If it has been parked all night on the street, especially over a cold winter night, the time of starting is probably longer. He drives down town with his mind set on a particularly convenient locality in which to leave his car. At least 99 times out of 100 he finds that place occupied by an earlier riser, and he spends ten minutes more looking for some other niche. It is probably three or four blocks from his office or wherever he desires to transact his business. Another ten minutes lost. Figure out what this selfishness is costing in time per day, week, month or year. Life is too short to throw away all this time to satisfy a purely selfish whim.

Another thing that is helping to congest our streets and highways is the present-day indiscriminate use of the automatic traffic signals. The best method of handling traffic is to get it quickly out of the way, and this the automatic light surely does not accomplish. On the other hand, in the majority of cases, the automatic light causes periodic congestion and thereby creates a useless hazard. We are not arguing against the traffic light, but only against its automatic feature. Wherever there is need of protection, there is also the need of an officer, in whose hands should be placed the operation of the light. In our opinion, neither an officer nor his assisting light should be placed at any point before there has been a thorough, scientific study of the traffic flow at that point. The argument has been made that no municipality can afford the expense of placing traffic officers at all the necessary locations. In the first place, such an argument is inherently wrong in that

**Abstract of a paper presented at the annual convention of the Pennsylvania Street Railway Association, held at Scranton, Pa., Dec. 1 and 2.*

Digitized by Google

every expense is justified that either tends to protect or save a human life, and in addition the proper kind of a traffic flow survey would probably disabuse their minds as to the necessity of such protection. Too many times many of our municipalities have been influenced by the suggestions of those who have formed a snap judgment of the wildest kind.

And now I come to the only real solution of the traffic problem. Two words express the idea, and those words are "unselfish co-operation." Nothing is ever accomplished in this world except by the co-operation of those interested. Surely we are both vitally interested in the lessening of congestion. You are avowedly public carriers. Each operator of a motor vehicle is a potential carrier. We both use the streets and highways—you through the privilege granted by your charter, and we motorists by reason of our citizenship. In time lost, in damage caused and in every conceivable way, we are both—your organization and the one which I represent—vitally affected. Let us both co-operate to the fullest extent in the attempt to better these conditions, which affect us both so vitally.

American Association News

Subjects for Engineering Committees

SUBJECTS have now been assigned to all of the committees of the Engineering Association, as announced briefly in this paper for last week. The report of the committee on subjects, giving these assignments, is given below:

Power Division

Special Committee No. 1—Review existing Manual sections of both power generation and conversion and power transmission and distribution; except Section D 200-26, covering specifications for electrical conduit construction, and Sections G 200-15 and G 201-21, which are assigned to special committees.

Special Committee No. 2—Continue the study of design and operation of mercury-arc rectifiers and mercury-arc rectifier stations, including standard specifications, particularly as to rating.

Special Committee No. 3—(a) Secure and compile information on power contracts and power costs, for confidential use at association headquarters, and (b) check detail of contracts obtained with Manual Sections G 200-15 and G 201-21 and determine whether any revision of these Manual sections is desirable.

Special Committee No. 4—Study desirability of the separation of current carrying apparatus and the control equipment in switchboard layouts.

Special Committee No. 5—Continue the subject of specifications for materials and construction for catenary trolley lines and prepare such additional specifications as may be considered necessary.

Special Committee No. 6—(a) Continue the study of trolley wire wear and breaks, with special reference to breaks due to causes other than normal wear, using the method outlined in previous reports and giving comparative wear on the basis of the car-miles operated; (b) determine to what per cent of the original cross sectional area trolley wire may be allowed to wear with maximum economy and safety, and (c) determine the practical and economical sizes of trolley support ears for general use and for various classes of service.

Special Committee No. 7—(a) Continue the study of inductive co-ordination and radio co-ordination maintaining contact with the American committee on inductive co-ordination, and (b) be prepared at any time to furnish information that may be desired.

Special Committee No. 8—(a) Continue the study of standardization of trolley wire reels, with the purpose of standardization, and (b) investigate braking devices on reels, in stringing trolley wires. Note: This committee should work in conjunction with the proper committee of the Division of Simplified Practice of the Department of Commerce in connection with the standardization of trolley wire reels.

Special Committee No. 9—Review Manual Section D 200-26, Specification and Form of Contract for Electric Conduit Construction, to determine the need for revising and enlarging this section in accordance with the suggestions made by the 1927 power transmission and distribution committee.

Special Committee No. 10—Study lightning protection of both car and line equipment. Note: This committee should consist of a joint committee of rolling stock and distribution engineers, in order that both phases of the subject may be given adequate consideration.

Special Committee No. 11—Investigate the comparative cost and reliability of overhead and underground d.c. distribution systems. This to include installation, operation and maintenance; obtain definite information from which city engineers and others interested in placing wires underground can be informed as to the relative costs and advantages of the two methods of distribution.

Special Committee No. 12—Investigate the use of ferrous and non-ferrous materials for overhead construction.

Special Committee No. 13—(a) Study the question of proper trolley voltage for congested urban districts with a view to determining the most desirable voltage under general conditions from the standpoint of operation and economy. To include the determination of the lowest trolley voltage which is suitable in city areas where it is impossible to reach the normal operating speed of the cars. Such things as operation of auxiliaries, such as lamps, air compressor motors, etc., to be considered, and (b) continue the study of the proper design of the distribution layout for automatic substations with particular reference to ties between stations and the use of sectionalizing switches.

Special Committee No. ( )—Determination of a measure of the use of labor and material in trolley line maintenance. Develop the practicability of establishing a standard by which the various methods of operating and maintaining overhead lines may be compared. Note: No committee has yet been organized to handle this subject, which was not discussed at the executive committee meeting, Oct. 5, 1927.

Purchases and Stores Division

Special Committee No. 1—Review existing purchases and stores sections of the Manual for revisions and corrections.

Special Committee No. 2—Study the advantages and economics of unit piling and standard packages and recommend a suitable system for use on electric railway properties.

Special Committee No. 3—Make a study of investment in material and supplies and the cost of operating stores with an analysis of the underlying data as to: (a) What is included in the account of Materials and Supplies by the various member companies; (b) what is charged to the account of Stores Expense; (c) what is the relation of stores expense to gross earnings, to cars and buses operated, to total investment in plant, to monthly disbursements, or to any other feature of investment or operation which will afford a basis for comparison and control, and (d) what are the physical or operating circumstances, if any, which have a special influence on the subject; also suggest the most practical and effective method of gaging the cost of operating stores to be used as a guide to good practice.

Special Committee No. 4—Recommend methods and practices for keeping price records and pricing materials and supplies received and issued.

Rolling Stock Division

Special Committee No. 1—(a) Review existing equipment Manual section with the exception of those referred to in 1 (b) below: (b) The standing committee on rolling stock will continue its study of revisions proposed in the 1927 report of way and structures committee No. 1, in Manual sections B 100-23, B 101-25 and B 201-24.

Special Committee No. 2—(a) Continue the subject of motor coach design and standardizations; the committee to continue to work in conjunction with the standardization committee of the Motor Coach Division and the Society of Automotive Engineers; (b) investi-

Digitized by Google

gate maintenance methods and inspection schedules and consider prescribed standards covering limits of wear parts as a means of efficient and economical maintenance; (c) consider the matter of bus design from the standpoint of unit construction and accessibility to wearing parts which is of vital importance to economical maintenance, and (d) consider the standardizations of automotive foundation brakes, metallurgical content of drums and other features of the braking problem that would tend to improve conditions.

Special Committee No. 3—(a) Continue the study of car equipment with special reference to appearance, comfort and convenience. Work to be co-ordinated with the committee on unification of car design. This study to include subjects of car nosing, ventilation and the need of a thrust device for journal boxes, and (b) investigate the relative economies of new types of power drives.

Special Committee No. 4—(a) Investigate the subject of head and tail lighting requirements, in addition to rear end markers and any other accessory lighting, such as signal lights and destination lights; (b) investigate the illumination of electric railway properties from trolley voltage supply, and (c) continue the study of car lighting with a view to improvements and economies due principally to standardization and uniform practices. Develop recommended practice in lamp inspection on proper specifications for lamps for a given system.

Special Committee No. 5—Continue study of results being obtained with roller bearings for journals.

Special Committee No. 6—Continue the study of gear lubrication.

Special Committee No. 8—Continue to investigate side wear on brushes of ventilated motors.

Special Committee No. 9—Continue the study of reduction of noise in car operation.

Special Committee No. 10—Investigate the welding of wheels, flanges, collaborate with way and structures committee No. 6.

Special Committee No. 11—Continue study of overhead current collecting devices and recommend standards for trolley wheels.

Special Committee No. 13—Continue the study of limits of wear.

Note: Special committees No. 7 and No. 12 have been discharged for the current year.

Way and Structures Division

Special Committee No. 1—Review existing sections of the Manual on buildings and structures, way and wood preservation.

Special Committee No. 2—(a) Continue study of design of switch tongues and hard centers for special trackwork; (b) review specifications for castings in iron-bound, hard-center special trackwork, with the view of possible revision of requirements for depth of casting and general design; (c) study of design of expansion joints for street railway track; (d) maintenance standards for track switch tongues in paved streets. Note: Establish, if possible, a maintenance standard for electrically actuated track switches in paved streets. Switch points so operated should require closer attention as to cleanliness, limits of wear, adjustments, etc., than those not so operated. It is believed, however, that a standard of maintenance for electrically operated switches might be applicable also to manually operated switches. (e) Prepare suitable plans for street railway spring switches and frogs and prepare a specification and drawing of a suitable spring-actuating device, all of which is to be incorporated in Manual Section W-108-23; (f) prepare a special design or plan for the use of narrow-tread wheels, of double spring rail frogs with a spacer between the two movable wings so that they are only partly spring acting.

Special Committee No. 4—(a) Study matter of type of ballast for track construction in paved streets to determine the relative advantages of each type with special conditions of subsoil, car loadings, etc.; (b) investigate the use of vitrified or tile pipe auxiliary drains in connection with track construction in paved streets.

Special Committee No. 5—(a) Study of treatment of poles and timber in place; (b) study actual economies obtained by operating utilities through the use of treated timbers; (c) study wood preservatives other than creosote and zinc chloride, and (d) investigate the possibilities of a combination preservative fire preventive treatment for timber.

Special Committee No. 6—(a) Study arc welding processes for repairs to rails and manganese steel, co-operating with the Welding Society, and, (b) prepare welding wire specifications.

Special Committee No. 7—Investigate the possibilities from the use of alloy steels other than manganese for special trackwork purposes. Observations to be continued of installations of chrome nickel steel in special trackwork and that the experiment suggested by last year's committee be carried to conclusion.

Special Committee No. 8—Study types of pavements, contour and foundation and recommend types of construction suitable for the modern heavy load conditions on city streets.

Special Committee No. 9—(a) Study the effect of garage design on insurance rates (in co-operation with the N.F.P.A. and other interested organizations). This should include such items as (1) Types of heating plants, (2) design of inspection pits, (3) gas, oil and water servicing facilities for buses, (4) floor drainage, (5) ventilation, (6) fire extinguishing apparatus, including automatic sprinklers; (b) study of door design to include recommendations as to proper width of door openings, details of construction, and general arrangement. This should cover such types as single or multiple sliding doors, plain hinged doors, rolling lift doors, jackknife or folding type and any other on which information may be obtained; (c) study maximum floor grades for bus garages; (d) study illumination both natural and artificial; (e) study bus washing facilities; (f) study provisions for compressed air lines for inflating tires, and (g) general study of ideal layout for various street frontage condition.

Special Committee No. 11—Co-operate with the A.S.M.I. in the consideration of any changes in the track and pavement construction specifications which may be proposed by either organization.

Special Committee No. 12—Continue study of rail corrugation; (a) continue collection of data from companies which are now co-operating, and (b) install sections of track for test purposes, with the end in view of determining a type of track which will better resist corrugation.

Special Committee No. 13—Study design of joint railway and bus terminals.

Special Committee No. 14—Study subject of rebranding rails to obtain uniformity in practice. Committee to study branding practice established by A.E.R.E.A.

Special Committee No. 15—Prepare a design of track gages for measuring and checking gage of track. Check gaging points on rails and wheels to determine if present practice is correct.

Special Committee No. 16—Study the subject of foundation and supporting structures for steam railroad crossings and other special work layouts.

Note: Special committees No. 3 and No. 10 have been discharged for the current year.

Committee on Heavy Electric Traction

1. Review existing Manual sections.
2. Continue study of track and third rail bonds for heavy traction work.
4. Continue study and collection of data on branch lines electrification and self-propelled cars and locomotives.
5. Continue study of operation of articulated trains, collecting descriptive information.
6. Study train make-up and terminal switching with multiple-unit cars, collecting and compiling data on same.

The report was signed by F. H. Miller, chairman; Morris Buck, C. H. Jones and P. V. C. See.

Service Betterment

WORK for the coming year was planned at a meeting of the committee on service betterment held at association headquarters, New York City, on Dec. 13. It was decided to concentrate on three subjects: Speed, training employees, and utilizing old equipment to the best advantage. Subcommittees were appointed to study each of these subjects. The next meeting will be held at Cincinnati in January at the time of the meeting of the Central Electric Railway Association. Members present at the meeting were W. E. Wood, chairman; R. N. Graham, J. F. Craig, E. A. Palmer, C. W. Wilson, E. E. Bodine representing C. L. Van Auken, and Paul Wilson, sponsor.

News of the Industry

Messrs. Hughes and McAdoo Appear in Piedmont Case

Oral argument was heard on Dec. 9 before the Interstate Commerce Commission on the application of the Piedmont & Northern Railway to construct an electric line from Spartanburg, S. C., to Gastonia, N. C., a distance of 53 miles, and from Charlotte to Winston-Salem, N. C., a distance of about 75 miles.

An Interstate Commerce Commission examiner ruled against the proposed construction, holding that it would result in unwarranted duplication of existing railways; would impair their facilities, by diverting their traffic, and would not perform any service that cannot now be performed by existing lines.

Charles Evans Hughes appeared for the Piedmont & Northern, while William G. McAdoo appeared for the Georgia & Florida, which is supporting the Piedmont's application. Mr. Hughes argued that the proposed construction was part of a project begun in good faith prior to the enactment of the transportation act. He asserted that public officials and representatives of various industries were unanimous in their support of the proposal, and termed as a "figment of the imagination" the charge of the Southern Railway that it would injure that road's credit.

The Piedmont & Northern further claims that since it is an electric road it should be classed as suburban and that the commerce commission for this reason does not have jurisdiction. It also claims that since the road was started before the present law became effective, and was delayed in completion by the war, this is an additional reason why the commission cannot take jurisdiction at this time.

The Southern Railway and other steam lines are opposing the application.

Preservation of 5-Cent Fare Involved in New York Suit

In a brief filed on Dec. 9 with the Appellate Division, to which the City of New York has appealed from a ruling of Supreme Court Justice Wasservogel, William G. Fullen, counsel for the Board of Transportation, argues that the preservation of the 5-cent subway fare and the saving to the municipality of millions of dollars is dependent upon the four-year bond policy recommended by John H. Delaney, chairman of the board.

William Jay Schieffelin opposes the board's policy on the method of financing and advocates a 50-year bond program. He brought mandamus proceedings to enforce his theory and to restrain the Board of Estimate from including an item of $13,000,000 for amortization in the 1928 budget.

Included in the brief filed by Mr. Fullen was the assertion that "on the basis of the proposal to issue four-year bonds at 5 per cent, the cost to the city of $1,000,000 of rapid transit bonds would be $200,000, whereas under the existing 50-year bond plan the cost of $1,000,000 in 5 per cent bonds at the rate of $50,000 in annual interest would be 50 times greater, or $2,500,000."

The brief contends that the plans adopted will make possible uninterrupted progress in subway construction without creating a situation which would hinder the continued development of other public works. It urges, also, that a writ of mandamus is not the proper remedy, and that the determination of the financial policy to be adopted is within the discretion of the Board of Estimate and is not subject, under the terms of the city charter, to judicial review.

The brief denies that the Board of Estimate is restricted to the issuance of bonds for a minimum of twenty years duration, as Mr. Schieffelin contends. It contends that the financial policy advocated by Mr. Schieffelin would be very costly to the city in comparison to that formulated by the Board of Estimate.

Elimination of Parking in Downtown St. Louis Recommended

Director of Streets and Sewers Brooks of St. Louis, Mo., has caused to be presented to the Board of Aldermen a bill to eliminate all daytime automobile parking on Washington Avenue, Locust and Olive Streets in the downtown district. No parking will be permitted on the streets named between Fourth Street and Twelfth Boulevard between the hours of 7:30 a.m. and 6 p.m.

Director Brooks declared that this legislation was vital because "traffic was strangling itself through its own bulk." He took the position that parked cars at the curbing in the retail business sections of the city not only impeded the free movement of street cars, buses and other automobiles and horse-drawn vehicles, but also discouraged downtown shopping.

Clearing the Atmosphere in Chicago

City Council and companies resume franchise negotiations. Corporation Counsel to study company suggestions and report back. Mayor Thompson to take a hand

REFUSAL of the surface and elevated lines of Chicago to accept a franchise for a fixed term of years or for legislation providing for termination of grants by forfeiture of their properties marked the reopening on Dec. 9 of the first joint meeting of local railway executives and the members of the City Council transportation committee since the bills representing the city's views on legislation necessary to solve the local transit problem were completed and handed over to the companies for study and revision on Dec. 1.

The principal differences between the revised bills and the companies' bills, which were killed at the last session of the State Legislature, are the provisions for granting by the city of either a terminable permit or a long-term franchise and for increased representation of the city on the proposed local transit commission.

Patrick J. Lucey, attorney for the Chicago Rapid Transit Company and also delegated to speak for the Chicago Surface Lines, contended that the forfeiture clause was unnecessary in the terminable permit bill, whereby the city would be allowed to specify in its ordinance what should constitute cause for termination, and that it would have a bad effect on the sale of the securities of the proposed unified transportation system. He said that in order to finance the proposed consolidated system perhaps as much as $500,000,000 would be required. As he sees it, the public would only invest its money in these securities if it were sure that they were safe from political interference. He illustrated this point by referring to the present depreciated value of Chicago Surface Lines securities. The value of these lines as shown by their capital account, he said, has probably greatly increased, but under the rigid twenty-year franchise the value of their securities will probably never increase.

In lieu of this feature, Mr. Lucey proposed an amendment allowing the city not only the right to buy the lines itself in case of non-performance, but to designate a purchaser to act under the same terms as those open to the city.

In commenting on the third bill, amending the cities and village act to permit term franchises for a period not to exceed 40 years, the companies' spokesman repeated that only a terminable franchise is acceptable. If, however, the bill is approved, he suggested that the length of the term

Digitized by Google

grant be left to the option of the City Council. In reply to the Aldermen's objections that such an arrangement would remove the city's only safeguard against franchise abuses, Mr. Lucey declared that the people would be amply protected by "home rule" and the right of appeal to the courts. He said the companies were perfectly willing that the city and the public be protected, if the companies also were protected against confiscation.

Except for a few changes in legal phraseology, the consolidation bill is acceptable to the companies, as is the bill which would create a local regulatory commission.

The railway attorney's criticisms were forthwith referred to the city Corporation Counsel, who will study them in company with the local transportation sub-committee and make recommendations back to the full committee.

A Necessary Supplement to a Luxury

Baltimore brief so sees the street railway of the present day. Picture of changes affecting electric railways presents economic factors in a fascinating way and in terms readily understandable

DECISION is expected soon in the case now pending before the Public Service Commission of Maryland in which the United Railways & Electric Company, Baltimore, seeks:

(a) A flat 10-cent fare, with corresponding increased special fares.

(b) An increased annual allowance for depreciation that will approximate 4 per cent of the value of its depreciable property.

Briefs were filed by the company and by attorneys representing opponents, and arguments were made before the commission on Dec. 8 and 9, after a protracted hearing, during which 122 exhibits were filed with the commission by all the parties. The company contends that without the advance in fare and an increased depreciation allowance it cannot render adequate service and earn a return on its property consistent with its constitutional rights. The company seeks "not less than a fair return on the fair value of the property and not more than the value of the service to the customer."

The company's position as stated in its brief is:

1. "Flat" 10-cent fares (with corresponding increased special fares) are in themselves reasonable to its customers — not more than the service is worth.

2. Such increased fares will yield the company less than a fair return on the fair value of its property—even less than the constitutional protection against confiscation.

3. Compulsory limitation of the company's rates to yield a maximum of less than 8 per cent is confiscatory.

The company contends that "a 10-cent fare would now give the customer more for his money than the pre-war 5-cent fare gave him." It offered evidence to show the public's capacity to pay the 10-cent fare and discussed the changed conditions in the electric railway business as a result of the increased number of private automobiles now in use. It declares that the railways today are "a necessary supplement to a luxury."

The company states in its brief:

> . . . the very nature of the service has been revolutionized. The population lives—and to a considerable extent dies—on wheels, moving or parked; not street car wheels. Automobiles not only take traffic from the street cars; they block what they do not take. Municipal regulation only aggravates the parking nuisance; automobiles are kept moving from place to place playing "tag" with the public. The number of automobiles participating in the nuisance—and the extent of the interference with street cars—is thereby increased. Pleasure riding on street cars is a thing of the past. Children and flappers alike get no "kick" out of a street car ride. The company still conducts pleasure resorts, which provide the jazz necessary to existence, but the patrons (who can neither park a street car no "step on the gas" in one) are largely transported there in automobiles.
>
> Formerly the exclusive means of transportation for practically all, the street car is still a vitally necessary service for practically all, exclusive for almost none. Seventy-five per cent, men and women, go to and from work on street cars, 25 per cent in automobiles. For the 25 per cent the street car renders "break-down" service only; for most of the other 75 per cent a supplemental, stand-by service. The majority of families in and around Baltimore must own an automobile; perhaps the majority of the 75 per cent who go to work on street cars. Those who do not own automobiles are largely transported by those who do; many, both white and colored, use some of the 4,000 taxis, who never used the 233 hacks and cabs of twenty years ago; others patronize "drive-it-yourself" concerns. The workers, men and women, use the street cars at the same peak hours; other members of the same families use the family automobile at off-peak hours. Thus, while the company's passenger revenue and revenue passengers continue to decrease, its peak burden is actually increasing. The public demand for the automobile has thus changed street car service from an exclusive, all-day, night and holiday service into a peak and stand-by service, essentially different and more expensive, though still far less expensive than the automobile.

The value of the service rendered by the company and the public's capacity to pay for it "are alike demonstrated by the very demand for automobiles which has made this service necessary and the capacity to pay which has made this demand possible," the brief states.

The company points out that the use of automobiles has increased even more than the number. The company says:

> Generally speaking, service worth having is worth what it costs, including in such cost, of course, a fair return on capital. This is the economic law in the competitive field when buyer and seller are free to pick and choose unregulated and unrestricted. Prices fluctuate up and down with fluctuations in demand and supply; when demand and supply are balanced prices reach their normal level at cost of production (i.e., reproduction.) Public regulation does not diminish the value of service, though it may diminish or, unwisely exercised, may increase the cost of service. Though a street railway system remunerative as a whole may under exceptional circumstances include some unremunerative parts, the general rule is that not only the whole business but each part should yield substantial compensation over cost. Certainly the service as a whole, if it is worth having, is worth paying for.

The point is made that "value of service to the customer is not less, but may be and frequently is much more than is commonly paid for such service." What is paid in other cities is held not to be conclusive as to what ought to be paid in Baltimore, "because costs—and also franchise conditions and other contractual legislation preventing fare changes—are seldom the same in two places." Nevertheless, says the company, the fact that 219 cities throughout the country have a base fare of 10 cents, and that Boston and 29 cities smaller than Baltimore have a flat fare of 10 cents, "is conclusive evidence that 10 cents is not more than a street car ride is worth. In other cities lower fares are less than the service is worth. If a fare lower than 10 cents would yield this company a fair return on its property, then such a fare would enable the customer to get the service for less than its value to him. Since a lower fare will not yield a fair return to the company the customer is not entitled to such a saving; in a 10-cent fare, however, he will pay no more than the service is worth."

The company meets squarely the prophecy that an increased fare would cause "losses of business so heavy as to decrease revenue in spite of increased fares." After the increase to 7 cents on Dec. 31, 1919, passengers increased 10,000,000, from 244,000,000 in 1919 to 254,000,000 in 1920. The decrease to 225,000,000 in 1926 includes the loss of 10,000,000 fares (not passengers), though counted as passengers, through zone extensions," the brief states. The company says:

> Sometimes increases, sometimes decreases in railway business have occurred after fare increases or decreases but seldom have resulted from them. Not only in Baltimore but in Boston and throughout the United States, whether fares have been increased to 10 cents or to lower amounts or have been decreased, the evidence shows no substantial effect of fare increases or decreases on the volume of business. Even if the data submitted had shown that in most cases increases in fares were followed by a noticeable falling off in riders, and vice versa, this alone would not indicate that such change in fare was the cause of the change in riders, because fare increases are ordinarily applied for and

Digitized by Google

granted on a falling traffic and fare reductions ordered when business is increasing. As. Dr. Hollander (Jacob H. Hollander, professor of political economy Johns Hopkins University) expresses it, the demand for street car rides is relatively "inelastic." The last decade of street railway history, including the disastrous story of receiverships of many interurban and suburban and a number of urban street railways, reveals practically nothing about the economic limit to productivity of increased fares. Not one instance has been found of a company which lost money through too high fares or has gained or saved money through reducing or not increasing fares.

An interesting statement is made in reply to pleas of opponents of the company that the commission consider the "necessitous rider" and the social plight of the unemployed and of the entire families. Says the company:

If the term "necessitous rider" is intended to indicate the fact that the company's service is a necessary service, this fact is admitted; to none is the service more necessary than to the automobile owner who uses it as "break-down" service and stand-by service. The necessity for the service is no reason why it should not be paid for. If "necessitous rider" means the rider who does not own an automobile, then it is equally true (1) that the changed economic conditions caused by the automobile, not by the company, are facts which can no more be escaped by the company or by those who do not own automobiles than changed physical conditions can be escaped by the hapless pedestrian and (2) that with generally increased wages and standards of living the minority families who do not own automobiles are even better able to pay carfare than the majority who have automobiles to support. The unemployed, like the sick, the injured, and other unfortunates, cannot get food, clothing or shelter without paying for it, but they need not pay carfare at all.

The following paragraph is an interesting commentary on the changed social life of the public:

Women do not go to work to pay carfare; they may pay carfare to go to work. They go to work in increased numbers largely to help pay the cost of automobiles and other luxuries formerly rare, now general. Formerly the same street car carried a man to work at the peak hours, a woman shopping at off-peak hours, and in summer both to a park or pleasure resort at night. Now street cars carry both the man and woman to work at the same peak hour, neither of them at other hours while they are at work or at night while they are out in an automobile. Thus the amount of railway business is decreased, but at the same time the peak load is increased.

In discussing the economic changes further the brief states:

No other utility has suffered an economic revolution more complete or more obvious than the change in the railway business from a monopoly of local transportation for both necessity and pleasure, operated at minimum expense, to the status of a supplement, albeit an indispensable supplement, to the automobile, which now dominates transportation, not to say life itself in America. An inexpensive necessary monopoly has become an equally necessary but also expensive supplement to a more expensive luxury. The bulk and the burden of transportation still are and must continue to be borne by the street railway; the changed conditions of this transportation, however, including diminished receipts and increased expense, are controlled by the automobile.

In every aspect of the matter the passenger who pays a 10-cent carfare in the Age of Jazz gets more for his money than did the passenger who paid a 5-cent carfare in the Age of Innocence.

In an exhibit filed with the commission the company estimates that its revenue for 1928 on the basis of flat 10-cent fares would be $5,578,079, or 7.1 per cent of $78,005,270, the fair value of its property. It contends that this return would be less than a fair return on the fair value, "even less than the constitutional protection against confiscation." In making its estimate the company provides an allowance of 3 per cent decrease in passenger revenue to cover the present decrease in revenue passengers, and 2 per cent to cover any possible decrease due to increased rates.

The company also is contending for an increased depreciation allowance. It declares that $2,200,000, approximately 4 per cent of the undepreciated base value (exclusive of overheads and going value) of the company's depreciable property as valued by the commission, plus additions since Jan. 1, 1924, would be a reasonable annual allowance, in order to provide for retirements as they occur from year to year, without accumulating any substantial reserve.

It also contends that "compulsory limitation of the company's rates to yield a maximum of less than 8 per cent is confiscatory." The brief says:

For some years railway properties have not been earning 8 per cent. The return has not been sufficient to induce investors to build railways at all or to buy them on the basis of an expected return of less than 8 per cent. Railways have been unable to complete successfully for capital with other lines of industry. The credit of either a power company or a telephone company is much better than that of street railways. The most serious hazard of railways is inability to get a return. Another hazard of utilities is the difficulty in promptly advancing their rates to overtake increases in cost of operation. In all these respects the condition and the credit of railways are worse than before the war.

Meeting the question of opponents, "Why should the expense of a declining business fall on its present customers in increased fares?" the company says:

Why not, if the fares are not more than the value of the service to the customers and not more than a fair return to the company? Even in a self-exhausting business, regulated or unregulated, e.g., natural gas, coal, oil, etc., service must be paid for at what it costs. Constitutional rights of property are the same in respect to a waning business or a growing business. The company's business, however, is not a waning business as to customers, though it is as to earnings. Its propery is all used, useful and necessary in the public service; its service is used by everybody, but not to the same extent as formerly. The peak burden on the company and its property continues to grow. The public, who require this peak service, make less use of the company's service at other times than it formerly did. All this is no reason why this changed service should not be paid for at a changed price necessary to compensate for the changed cost caused by the changed use which the public sees fit to make of the company's property.

Another Readjustment Move Presaged in New Jersey

Amended articles of incorporation have been filed for the Public Service Transportation Company, Newark, N. J. The move is believed to be the result of almost a year's work on the part of a committee of directors appointed to work out a plan for the readjustment of the transportation units of the Public Service Corporation. The transportation company is the bus operating concern and the only changes made by the new articles of incorporation are in the charter which is now issued under the transportation act. The Public Service Railway is the trolley operating company of the corporation. Under the new charter the transportation company will have 1,500,000 shares of common stock, of no-par value, which is the same amount as now held by the old transportation company organized under the general corporations laws. Under the traction act it will be possible to merge the two transportation units of Public Service when the time comes.

Agreement Reached in Chicago

Following a series of conferences between the operating board of the Chicago Surface Lines and representatives of Local 241 of the Amalgamated Association, a supplemental agreement for arbitration of wages and other points at issue was signed on Dec. 12. The agreement removes the possibility of a strike and as a result the proposed mass meeting of the union set for Dec. 14 was canceled by William Quinlan, president.

Under the terms of the new agreement, Judge Scanlan and Mr. McIlraith, appointed last summer, withdrew as arbitrators and Guy A. Richardson, vice-president of the Chicago Surface Lines, representing the company, and Alderman Oscar F. Nelson, representing the union, are appointed in their stead. If they cannot reach an agreement, they must proceed to select a third man and then consider the whole matter. In case of an agreement between the two arbitrators, they are empowered to make an award which can be continued in effect until June 1, 1930, but if they require the assistance of a third arbitrator the award can be extended only to June 1, 1928. The two arbitrators are to meet from day to day for the purpose of reaching a decision.

The agreement was submitted to and approved by Judge James H. Wilkerson of the United States District Court, owing to the fact that the Chicago Railways, one of the underlying properties, is in receivership in this court.

They Miss Their Interurban, Do Holland Merchants

When the Grand Rapids, Holland & Chicago Interurban Company went out of existence last year it proved a bad blow to industries in the city of Holland, Mich. In the southwestern part of the city were many industries that were equipped with sidetrack facilities to the interurban line, assuring them prompt shipments day or night. When the interurban road was junked the industries had forcibly brought to their attention the value of the interurban to the city. Shipments were delayed, trucks had to be purchased and resort made to other measures in meeting the need of shipping facilities.

A Chicago company tore up the tracks leaving the right-of-way in the hands of the Consumers Power Company, Grand Rapids. Now these industries have awakened and have leased the side track rights-of-way and are using the interurban rails to finish connections with the Pere Marquette Railroad with which they were formerly tied by rail. The interurban roadbed is being used, but new switches, rails and other equipment are being installed by the Pere Marquette Railroad.

Ten Cents in Lansing

New fare rates on the lines of the Michigan Electric Railway in Lansing, Mich., went into effect on Dec. 14. The new rate is 10 cents cash, with three tickets for 25 cents; 5-cent children's fare and seven workmen's tickets for 50 cents.

Information Bureau in Baltimore

The United Railways & Electric Company, Baltimore, Md., has opened a general information bureau for the public at 5 South Calvert Street, Baltimore, with Harry W. Mears of the company's service department in charge. Here complaints will be received and adjusted and all information dealing with the railway system and the city generally will be supplied.

A Wise Administration Expected in St. Louis

The press no less than the public has started the reorganized St. Louis Public Service Company on its new task with encouragement and hope for a bright future. In its editorial columns the St. Louis *Globe-Democrat* has this to say on the new start for the electric railway system:

> And St. Louis may take courage in viewing the character of the directors elected to manage the new Public Service Company. They are local men of affairs who have displayed their talents for the direction of large enterprises in many ways. They personally enjoy and deserve the confidence of the general public and are intensely interested in the progress of St. Louis, and the surrounding territory as a business community and a home center. Aside from uprightness of character, these directors will take a broad view of their responsibility in handling the affairs of the transportation company and build for the stockholders and for the community in conformity with the mutuality of interests.

A New Guide for Milwaukee Visitors

A new railway and bus guide of Milwaukee, Wis., and suburbs containing a map and index of streets, parks and other points of interest is being distributed by the Milwaukee Electric Railway & Light Company. The map in a greatly enlarged form is being placed in hotels and newspaper offices.

For the Benefit of St. Petersburg Pass Purchasers

R. E. Ludwig, director of public utilities at St. Petersburg, Fla., has announced that arrangements have been completed for the sale of weekly passes and street car tokens for the municipal railway at the new municipal bureau of information and complaints at the City Hall each Saturday afternoon hereafter. The passes go on sale regularly each Friday for the following week at the municipal railway office in the finance department, but that office is closed to the public at noon on Saturday, when the sales will be transferred to the information bureau.

Ten Cents in Atlanta

Ten cents cash, four tickets for 30 cents or twenty for $1.50, with school children's rates, 5 cents, are the new fares to be charged by the Georgia Power Company, Atlanta, Ga., set down in an order of the Georgia Public Service Commission on Dec. 6. The present fare is 7 cents cash, three tickets for 20 cents or fifteen for $1, with no children's rates.

The school children's tickets are to be sold in lots of twenty for $1 at the company office on presentation of a certificate signed by the principal or teacher. These tickets are good on school days between the hours of 7 a.m. and 4 p.m.

In the company's petition to the commission a request was made for a 10-cent cash fare and three tickets for 25 cents.

Office Changes Made

Passenger and freight offices of the Chicago, North Shore & Milwaukee Railroad in Milwaukee have been moved from the Security Building to the terminal building of the road. The space formerly occupied by the restaurant has been remodeled. B. W. Arnold and the legal and medical representatives will remain in the Security Building.

New Routes Opened in the Twin Cities

Operation of cars of the Minneapolis Street Railway, Minneapolis, Minn., over the new bridge across the Mississippi River to a point adjacent to the plant of the Ford Motor Company in St. Paul was begun Dec. 2, the day the new Ford car models were put on display in the Twin City plant. The tracks were laid several months ago, but the Kenwood-East 25th line has heretofore looped several blocks from the bridge. Extra service was put into effect on the Randolph-Hope line to the Ford plant by the St. Paul City Railway in anticipation of increased activity there.

The Bryn Mawr line in Minneapolis was reopened Dec. 3 over a new bridge across the Great Northern & Minneapolis & St. Louis Railroad tracks after being interrupted several months. This enables the company to reduce emergency bus service to Bryn Mawr by another route.

Extension of the Franklin Avenue line in Minneapolis and a proposed route to serve prospect Park residents up to the St. Paul city line has been approved by the City Planning Commission, and was reported as being up to the City Council for action. The route obviates engineering problems due to grades by direct extension across Franklin Avenue to the city limits.

Free Rides in Fort Wayne

An innovation in transportation was tried out Dec. 1 in Fort Wayne, Ind., with fine results with the Indiana Service Corporation aiding in opening the Christmas shopping season in the downtown business district by providing free transportation to every one between 6:30 and 7:30 in the evening in order for them to get to the shopping district early and free. Hundreds took advantage of the offer and went to the business district who would probably not have gone otherwise. The free ride stunt appears to have paid big dividends in good will.

Educational Courses in Michigan City

A short course for the benefit of its employees to acquaint them with the essential facts concerning the line and its operations and to fit them to tell the railroad's story to the public has been started by the Chicago, South Shore & South Bend Railroad. The first meeting of the class in which members of all departments are enrolled was held Dec. 1 in the South Shore Line's new Michigan City, Ind., station. The course of instruction will consist of a two-hour session one night each week for eight weeks. A well known lecturer and public speaking authority of Chicago is in charge. Students will be instructed in public speaking and the operation of stereopticon and moving picture machines.

Public Hearing on Kansas City Short Line Project Concluded

Public hearing on the application of the St. Louis & Kansas City Short Line Railroad for a certificate of convenience and necessity for the operation of an electric railway between St. Louis and Kansas City was concluded by the Missouri Public Service Commission on Dec. 9. J. B. Collins, Kansas City, one of the chief promoters of the enterprise, declared on the witness stand that he believed the bus and motor truck competition with the railroads was not the bugaboo that the steam railroad officials believed it to be.

Mr. Collins was subjected to a searching cross-examination by Judge J. F. Green of the Missouri Pacific, Carl Hoffman of the Missouri-Kansas-Texas and L. H. Stroesser of the Wabash. They were especially anxious to ascertain how the short line railroad, if built, would develop new business to support it. In reply he stated that new business would be developed by the establishment of industries along the line and through the development of resources that are now dormant. He estimated the business of the new road would total $5,000,000 annually. Judge Green in this connection pointed out that $5,000,000 was more than the annual business of any of the steam railroads between St. Louis and Kansas City. Mr. Collins answered that he felt his line would get the bulk of the business for the reason that it would be the shortest line between the cities and that it would operate through trains on a five-hour schedule, while at present the steam lines require seven hours for the trip.

The commission will fix a date some time in January for hearing arguments of counsel in the case. In the meantime both sides will file briefs. The Wabash, Missouri-Kansas-Texas, Chicago & Alton, Chicago, Burlington & Quincy, Chicago, Rock Island & Pacific and Missouri Pacific lines opposed the application of the interurban line. The line has sought since 1925 to obtain a permit to construct and operate. The commission rejected the first application on the ground that the company was not in a position to show its financial backing. A new application was filed Oct. 7.

Men in St. Louis Propose Wage Survey

W. R. Schneider, attorney for the local division of the Amalgamated Association, has been authorized to conduct a survey of the wage situation and also living expenses in other large cities. He has indicated that it will be several weeks before he is ready to report to the wage committee, which has been authorized by the executive committee to seek a revision of the wage scale in force by the St. Louis Public Service Company. Union officials say that St. Louis ranks ninth in the cities paying the highest wages to trainmen, now paid 56 to 67 cents an hour, according to length of service. Men working as laborers in the track division receive 38 to 45 cents an hour.

A Railway Employs Boy Scouts

The Retail Merchants Association of Lynchburg, Va., unable to charter street cars to haul their prospective Christmas shoppers to the stores, hit upon the happy idea of placing a Boy Scout, with a pocketful of nickels, aboard each car of the Lynchburg Traction & Light Company for one hour one morning recently. The youngsters distributed fares to all who requested them. Hundreds of women shoppers took advantage of the offer.

Hearing on Petition Postponed

Hearing on the application of the Pacific Gas & Electric Company and the Central California Traction Company for a 7-cent fare in Sacramento, Cal., has been postponed until Jan. 4. It had been scheduled for Dec. 6. The present rate in Sacramento is 5 cents.

"Northern Lights" on Thursday Nights

The Northern Ohio Power & Light Company, Akron, Ohio, continues to broadcast a program every Thursday night between the hours of 8 and 9 for the purpose of advertising its service. An orchestra has been organized known as "The Northern Lights," and usually there are two vocalists who broadcast over WADC. During the holiday week it is planned to use the First Congregational Church choir and St. Martha's Church choir.

Improved Service Means Higher Fare, Say Madison Employees

Employees of the Madison Railways, Madison, Wis., at their regular meeting adopted a resolution favoring an increase in fare as a solution for the improvement of service. The resolution follows in part:

1. We operate the cars and buses to give the best service we can. We try our best to avoid accidents, to be courteous to patrons, and to run the cars on time.
2. We know the company is spending every dollar of its present income to give the best service it can and that, in spite of this fact, we cannot keep up with the service demands of the public.
3. We have faith in the future of Madison and we want to see our customers have the very best transportation possible, but more and faster service means more double track, more cars, more buses, more employees, and more expense all along the line.
4. We are confident that the one and only way to thus improve the service is to grant the Madison Railways an increased rate of fare.

Proposal for Lengthening New York Subway Platform

The question of lengthening the Interborough subway local station platforms and the desirability of ordering the Interborough Rapid Transit Company to pay half the cost, estimated at about $16,000,000, was discussed by the New York Transit Commission on Dec. 13. Representatives of the company have questioned the interpretation of the commission that the contract requires the company to pay half the cost of improvements and have threatened to appeal to the courts if ordered to pay it.

Denver's Perpetual Franchise Upheld

The United States Court of Appeals has upheld the decision of the lower federal court to the effect that the Denver Tramway, Denver, Col., has a perpetual franchise. The franchise was signed in 1885 and 1886. It stipulates a 5-cent fare, but the fare was changed by the court from 5 cents to 6 cents during the World War. Judge Lewis in the federal court later raised the rate to 8 cents cash with two tokens for 15 cents. This is the fare now in effect.

President Howard S. Robertson says the company is being operated economically, but it is not paying anything like the 7½ per cent allowed by the court. The directors of the tramway, after they receive a full transcript of the Appellate Court's ruling, will meet and then a statement will be made as just what the company proposes to do.

Safety Via Radio and Poster Display in Jacksonville

Features of the safety campaign being conducted by the Jacksonville Traction Company, Jacksonville, Fla., in which all trainmen who operate 80 working days without a chargeable accident will receive turkeys for Christmas, were outlined over WJAX, the Jacksonville municipal broadcasting station, recently by the Rev. James Barbee, pastor of the Riverside Avenue Christian Church. This campaign as an important factor in cutting down the number of accidents was referred to by the Rev. Barbee, Herbert R. MacMillan, chief of the city's fire department, and Lieut. Francis Smith, head of the city's police traffic department, who spoke over WJAX in connection with the safety exhibits at the Florida State Fair and Exposition, sponsored by the Jacksonville Motor Club.

The Jacksonville Traction Company's exhibition at the fair has been favorably received by the local newspapers, which have devoted much space to news stories and photographs of the company's display. The main feature of the railway's exhibit is an impressive poster display. Some of the posters show in picture form the dangers of

Digitized by Google

passing from behind one street car onto the tracks of another and depicts other careless moves which have at times caused fatal accidents. A lesson for the operators is also seen in the posters. They will be placed on the street car property after the fair. Other signs ask the co-operation of the public and emphasize the increasing convenience of street car riding.

Stricter Safety Observance Recommended in Indianapolis

A letter has been sent to all electric railways operating in Indianapolis, Ind., signed by Claude M. Worley, Chief of Police, asking a stricter observance of the law requiring street car and interurban conductors to flag railroad crossings before crossing.

Continuation of Railway Service Ordered in Goshen

The well-known "one-horse" town has nothing on the "one-car" town of Goshen, Ind., which narrowly escaped being a "no-car" town recently by action of the Indiana Public Service Commission. In an order issued Dec. 2 the commission ruled that the single street car operated by the Chicago, South Bend & Northern Indiana Railway in Goshen be kept in service despite the fact that the company suffered operating losses last year of about $2,000. The commission ordered the railway to file a schedule for the continued operation and to see that such schedule was "reasonably observed."

A petition asking authority to abandon local service was filed by R. R. Smith, receiver for the railway. Accidents, it was alleged, were responsible for half the loss suffered in 1926. Patrons objected to abandonment.

$20,000,000 for Reading Electrification at Philadelphia

Some of the plans for the electrification of its railroad lines in and about Philadelphia were announced on Dec. 14 by Agnew T. Dice, president of the Reading company. Engineers of the company are actively engaged in completing plans for the electrification of the road from the Reading Terminal to Chestnut Hill, 12 miles from the city. Other improvements are predicted on the completion of this work, and when the Chestnut Hill line is in operation the company anticipates making extensions of electric service to Lansdale, on the Bethlehem branch, and from Glenside to Willow Grove, Pa. The next step will be a continuation to the New York branch, with the first projection of service being made from Jenkintown to Langhorne. The expenditure will be approximately $20,000,000, and the company anticipates embarking on the program within a few months.

Recent Bus Developments

Denial of Railway Petition to Revoke Bus Grant in New York

The Public Service Commission denied on Dec. 13 a petition by the New York State Railways to revoke the certificate issued May 6, 1920, under which the Clark Motor Service now operates over certain streets in Oneida and to Sherrill, N. Y. It further ordered the amendment of that certificate by directing that the bus line operation be limited to certain streets.

It was alleged by the railway that the bus company was unlawfully operating in certain streets in Oneida, not mentioned in its certificate and illegally competing with the railway, thereby violating conditions in the bus certificate.

The consent by the city or the certificate of the commission on May 6, 1920, did not specify a designated route in Oneida, but at the hearing before the Public Service Commission, Second District, on April 10, 1920, evidence was presented on the proposed operation over certain streets in Oneida. The commission further held that there was no evidence of intentional or deliberate violation by the bus company in operating over Oneida streets.

Expansion by Cleveland Southwestern

The certificate and property of the Cleveland-Elyria-Toledo Bus Company has been purchased by the Cleveland Southwestern Railway & Light Company, Cleveland, Ohio, following authorization of the purchase by the Ohio Public Utilities Commission on Dec. 12. With this purchase the Southwestern company immediately announced plans to co-ordinate its railway and bus services and schedules and announced the purchase of four new buses of the latest type and design. With the seven old buses taken over from the Elyria company this will give a de luxe bus service running from Cleveland to Elyria and Oberlin and ending at Norwalk.

Subsidy for Kansas City Bus Line Suggested by Public

The Southeast Improvement Association has promised the Kansas City Public Service Company, Kansas City, Mo., 350 passenger fares daily all winter on a bus line on 43d Street if the line is installed. This is 134 more fares than was reported one day recently on the 39th Street line east of Cleveland, the basis upon which the railway estimated only $14 a day in fares could be expected from a 43d Street line. The 350 fares a day would mean $22.25 a day, figuring 6½ cents a fare, transfers considered.

The association suggests that the stub line from 43d Street to 39th Street on Indiana be cut out and the bus be run to 39th Street, either on Indiana or a paved road adjoining. The stub line cars are said to be overcrowded mornings and nights. More than 500 homes have been counted in the district by the association, with four people to a home.

The Kansas City Public Service Company had estimated 200 homes in this district and fixed the net loss on the line from $7,500 to $10,000 a year.

Another Bus Line Acquired by Baltimore Company

The United Railways & Electric Company, Baltimore, Md., has announced that it has taken over the operation of the Lakeland-Baltimore Highlands bus line and that some new buses will be installed on the line. Other improvements are also contemplated.

Would Run Buses in Supplementary Service in South Bend

The Chicago, South Shore & South Bend Railroad has petitioned the Indiana Public Service Commission for authority to operate bus lines within the city of South Bend to supplement interstate railway service between South Bend and Chicago. According to the petition no additional charges would be made for the extended service.

No Safety—No Bus Between Fall River and Quincy

The Eastern Massachusetts Street Railway, which was recently authorized to operate a bus line between the Fall River Ship Yards and Quincy Center, Quincy, Mass., via South Street, has been notified that the State Department of Public Works will not permit buses to operate as proposed because the streets are too narrow and contain too many curves for safety.

Two Losers in Milwaukee Over Bus Competition

At the request of North Milwaukee officials, the Milwaukee Electric Railway & Light Company, Milwaukee, Wis.., is now providing bus service to the western portion of that city, served previously by a competing bus line. The line of the Milwaukee Railway & Light Company, however, connects with the city street cars at a convenient transfer point instead of operating on a parallel route to the downtown business district.

Press reports indicate that the competing bus line, which failed and suspended service, lost heavily from the start. Its routes paralleled those of the

Digitized by Google

railway in territory where there is not enough business to sustain duplicated service. The railway company also lost some traffic, but it did not reduce its service.

The Milwaukee company feels that this incident illustrates the folly and unfairness of such competition. It has been without redress in instances of this kind in the past, but the new state law, giving the State Railroad Commission power to pass upon the need of new bus routes, in the interest of the public, is expected to prevent unwise and unnecessary establishment of such routes in the future.

Hearings in New York Continued

The New York Transit Commission on Dec. 13 held another hearing on the application of the Equitable Coach Company for a certificate of convenience and necessity for operation of bus routes in Manhattan, Brooklyn and Queens, for which the Board of Estimate has awarded a franchise. Virtually all of the hearing was devoted to cross-examination by Clarence J. Shearn, of counsel for the Brooklyn-Manhattan Transit Corporation, of Alfred J. Doyle, a Board of Transportation engineer, on the necessity for the routes in Brooklyn.

Court Discusses Highway Legislation

United States Supreme Court, in decision just rendered, finds many unadjudicated questions presented in Hammond bus case. Remands case for further examination

IN A decision handed down Nov. 21 the U. S. Supreme Court points out that many points in the control which a city may possess over its streets remain to be determined. These observations were made in the case of the city of Hammond, petitioner, vs. Schappi Bus Line, Inc. The case arose when the city of Hammond, Ind., with about 60,000 inhabitants, passed an ordinance restricting buses from operating over certain of its streets, or from stopping to receive or discharge passengers on certain other streets without receiving permission from the Board of Public Works. It made an exception, however, of the buses of any companies with which the city had an existing contract. The purpose of the ordinance was declared by the city authorities to prevent congestion of traffic and to promote safety.

The Schappi company, which has been operating interstate buses over some of the streets in question, insisted there was no congestion, even in the business district, except such as resulted at times from the passing of railroad trains at grade and from the allowance of unreasonable parking privileges and that the real purpose of the ordinance was to protect from competition another bus company which came under the exception mentioned in the ordinance.

Case Appealed from District Court

The case was first tried in the District Court, which denied the interlocutory injunction asked. This decree was reversed by the Court of Appeals, which, however, did not give the grounds for its decision.

In its consideration of the case, the Supreme Court finds that "the issues of law are as serious and numerous as the questions of fact." It points out the claims of Schappi that the ordinance is in violation of the Indiana statutes and constitution and that it is also void under the Federal Commerce clause and Fourteenth Amendment. The Supreme Court therefore declared the case remanded to the District Court, as it involved questions which it did not feel like passing upon without a discussion of these points by members of the lower courts familar with the local law. In the meantime it directed an injunction pending the suit.

New Questions Involved

An interesting part of the decision are the remarks of the Supreme Court on the novelty of the questions involved. On this point it says:

The contentions made in the briefs and arguments suggest, among other questions, the following: Where there is congestion of city streets sufficient to justify some limitation of the number of motor vehicles to be operated thereon as common carriers, or some prohibition of stops to load or unload passengers, may the limitation or prohibition be applied to some vehicles used wholly or partly in interstate commerce while, at the same time, vehicles of like character, including many that are engaged solely in local, or intrastate, commerce are not subjected thereto? Is the right in the premises to which interstate carriers would otherwise be entitled, affected by the fact that, prior to the establishment of the interstate lines, the city had granted to a local carrier, by contract or franchise, the unlimited right to use all the streets of the city, and that elimination of the interstate vehicles would put an end to the congestion experienced? May the city's right to limit the number of vehicles, and to prohibit stops to load or unload passengers, be exercised in such a way as to allocate streets on which motor traffic is more profitable exclusively to the local lines and to allocate streets on which the traffic is less profitable to the lines engaged wholly, or partly, in interstate commerce? Is limitation of the number of vehicles, or prohibition of stops to load or unload passengers, of carriers engaged wholly, or partly, in interstate commerce, justifiable, where the congestion could be obviated by denying to private carriers existing parking privileges or by curtailing those so enjoyed? Are the rights of the interstate carrier in the premises dependent, in any respect, upon the dates of the establishment of its lines, as compared with the dates of the establishment of the lines of the local carrier?

These questions have not, so far as appears, been considered by either of the lower courts. The facts essential to their determination have not been found by either court. And the evidence in the record is not of such a character that findings could now be made with confidence. The answer denied many of the material allegations of the bill. The evidence consists of the pleadings and affidavits. The pleadings are confusing. The affidavits are silent as to some facts of legal signifiance; lack definiteness as to some matters; and present serious conflicts on issues of facts that may be decisive. For aught that appears, the lower courts may have differed in their decisions solely because they differed as to conclusions of fact. Before any of the questions suggested, which are both novel and of far reaching importance, are passed upon by this court, the facts essential to their decision should be definitely found by the lower courts upon adequate evidence.

On the same day that this decision was handed down the Supreme Court also passed upon a case of the same city of Hammond vs. Farina Bus Line & Transportation Company. While it declared some of the issues in facts and law were different from those in the Schappi case, it was also remanded to the District Court for further proceedings.

Miami Beach Service Increased

A new bus schedule offering increased facilities has gone into effect at Miami Beach following negotiations with the Miami Beach Railway. Five buses of 21-passenger capacity have replaced the three buses of 28-passenger capacity. The new system now in effect covers an increased mileage, totaling 860 miles a day. Transfers are given to any bus line from the street cars, or from bus to bus. The fare is 10 cents within the city, or from any part of the city to Miami.

Approval of Taxi Purchase Terms Sought

The Philadelphia Rapid Transit Company, Philadelphia, Pa., filed application on Dec. 6 with the Public Service Commission in Harrisburg for the acquisition of the Diamond Cab Company and the Cunningham Cab Company. According to the petition the P. R. T. desires to buy 410 shares of stock of the Diamond company and 750 shares of the Cunningham company for $250,000. The P. R. T. already owns the Yellow Cab Company. Brief reference to the plan of the P. R. T. to acquire these properties was made in the Electric Railway Journal issue of Dec. 10, 1927. In support of its petition, the P.R.T. argued that the absorption of the two independent companies by the Yellow Cab Company, now under operation of Mitten Management, Inc., would enable the railway to reduce cruising, thus relieving city-center traffic congestion. The gross earnings of the Cunningham Cab Company were estimated at $200,000 for the first ten months of this year by P.R.T. auditors.

Purchase Overtures Resumed

Special counsel for New York Transit Commission says renewal of purchase negotiations with B.-M. T. delays unification plan

RESUMPTION of negotiations with officials of the Brooklyn-Manhattan Transit Corporation for the purchase by the city of the company's elevated lines and its lease and interest in the city-owned subway system is given by Samuel Untermyer, special counsel to the Transit Commission, as the reason for his delay in submitting the unification plan, based on his report of recommendation of Sept. 30 to the commission.

Mr. Untermyer, in a statement made on Dec. 12, disclosed that the company now has experts making a valuation of its properties and on completion of their work the city will know just what the owners of the B.-M.T. will ask for their subway and elevated lines. It is understood, although Mr. Untermyer did not say so, that the company has abandoned its insistence that the city should buy its surface lines.

Mr. Untermyer's statement was in response to repeated inquiries as to how soon submission of the unification plan might be expected. He said:

Owing to the many and complicated questions involved we are still far from a conclusion. What will be the outcome no one can predict. The pivotal point will be, of course, that of the value and selling price of the elevated property.

The Transit Commission's physical valuations have long been in the possession of the companies. We have not received theirs, but physical values are not the ultimate criterion nor the most important element in the problem.

The B.-M. T. has for some time past had its experts at work. Very soon after they have completed their studies we shall know how much these gentlemen will expect for their elevated property. Meantime there are many other aspects equally important which are being and must be further considered.

PROGRESS NOT SLOW

I realize that progress during the past weeks has seemed slow to the outsider, but that is not the fact. We must ask the public to be patient. It may be that it will all come to naught. I can only say that the outlook is more encouraging.

It would be manifestly undesirable and unwise to put out a plan based on prices fixed by the commission and opposed by the companies with the alternate of recapture so long as there is any hope of avoiding that impass. If these negotiations fail or are too long protracted without making decisive progress, the plan will be put before the commission without further delay.

Later Mr. Untermyer reiterated that recapture would not result in the disruption of the Brooklyn rapid transit service. He said there could be joint operation of recaptured and recapturable lines by order of the commission. Mr. Untermyer added that the only threat to the maintenance of the 5-cent fare was through the inclusion in the readjustment plan of the elevated lines, which he said were losing money, but that it might be well for the city to buy them out of deference to popular opinion. He said:

My judgment that the best interests of the city would be served by recapture and the exclusion of the elevated lines, unless they can be acquired on very moderate terms, is not in the least altered by recent events, I repeat that this can be accomplished without the slightest inconvenience to the traveling public and without a double or increased fare, and that the car riders will in that way secure a vastly improved service and a longer haul.

The only threat to the maintenance of the 5-cent fare is from the inclusion of the elevated lines, both of which are now losing money and would be a still heavier drain if acquired at anything like the inflated prices that have been mentioned. The total cost of both lines on recapture, including all subway equipment, would be about $180,000,000. It would cost more than twice that sum to purchase them.

$18,000,000 Minnesota Issue Approved

The Minnesota Railroad and Warehouse Commission has approved the issue by the Minneapolis Street Railway and the St. Paul City Railway through the parent corporation, the Twin City Rapid Transit Company, of $18,000,000 of 5½ per cent lien and refunding gold bonds, series A, dated Sept. 1, 1927, and maturing in 25 years. The proceeds will refund obligations maturing Aug. 15 and Oct. 1, 1928, to a total of $15,000,000, with capital additions for improvements and extensions. The bonds were offered publicly during the week ended Dec. 10 subject to the approval of their terms by the commission.

$188,016,892 Boston "L" Reproduction Cost

Transportation value of the property fixed by state body at $118,837,253. Governor believes public control without public ownership to be ideal arrangement

BY A unanimous vote the Massachusetts Department of Public Utilities places the reproduction cost of the Boston Elevated Railway at $188,016,892, the transportation value at $118,837,253 and the book value at $109,103,445.

Right-of-way has a book value of $11,435,768 and a reproduction cost of $20,724,294. The largest single item are the cars and buses, with a book value of $16,325,134 and given a reproduction value of $22,761,311, but for transportation purposes, or carrying capacity, the value is fixed at only $14,569,190. Power plant equipment has a book value of $9,099,531 and a reproduction value of $11,434,666, but for transportation purposes this is estimated at only $4,498,342. The book value is the capital stock, bonds and premiums. This is found to be some $9,500,000 less than the transportation value.

The report was ordered by the Legislature. It was made public on Dec. 8 at noon. The document covers four questions:

1. The value for transportation purposes of the property of said company, and whether this value is more or less than the option price provided in Sec. 16 of Chapter 159 of the special acts of 1918.

2. Whether the value of said property for transportation purposes has been increased during the period of public control through expenditures from car fares and other revenue for maintenance, depreciation, reserves or otherwise, and if so, how much.

3. As to the reproduction value of the property of said company and to report its opinion as to the amount thereof, less a proper deduction for depreciation and obsolescence.

4. State its opinion as to the value of the surface lines abandoned by said company.

It has been pointed out that the important figure in the valuation of Boston Elevated property is the reproduction cost, less depreciation, which is $128,937,869. The department finds that to reproduce the road new would cost $188,016,892, but the road is not new so that depreciation of $59,079,023 is deducted to reflect wear and tear of property and equipment, etc. Stress is laid by one of the commentators as the fact that reproduction cost is a matter of only academic interest inasmuch as the state has an option to buy the road at a lower figure. However, it is of some value to the stockholders to know that their property, which is carried on the books at $109,000,000, would cost approximately $129,000,000 to reproduce. In fact, as the road carries a depreciation reserve of about $8,200,000, the excess appraised value is not $20,000,000 but $28,200,000.

It was provided in the public control act that the Commonwealth might buy the Elevated road for a price which, although not stated in the act, is found by the Department of Public Utilities to be a little more than $109,000,000. Assuming that the holders of the first and second preferred stocks exercised their right of conversion into common, and that the $3,000,000 so-called third preferred was called at 105, this price would work out about $111 a share for

Digitized by Google

the common. Consequently, as the state can buy the road at a figure which would give the common stockholders $111 a share, it makes no particular difference how much more than book figures the property may be found to be worth except of course in the unlikely contingency of return to private management. In that event the value of the property becomes all-important.

On Dec. 31, 1926, according to the Boston Elevated balance sheet, the book value of the $23,879,400 common stock was about $119 a share. This is after allowing par for the first and second preferred stocks which they would receive in liquidation unless converted into common, and is also after taking out $105 a share, the redemption price of the $3,000,000 so-called third preferred. The reproduction cost being $20,000,000 larger than the gross amount at which the road carries its property on its books, and $28,200,000 larger than the net amount, after depreciation, it follows that the book value is increased in the first instance to $202 a share and in the second instance to $237 a share. In other words, if the road were to substitute this $129,000,000 reproduction cost for its own valuation of $109,000,000, less $8,200,000 depreciation, the result would be a book value of $237 a share for the common. As already indicated, however, these calculations are essentially academic with the state holding an option to buy the property for $109,000,000.

Governor Fuller has made known that he is opposed to any plan for the exercise of the right of the state to take over the road. He believes the situation is one which gives the state a distinct advantage, but that the solution of the Elevated problem is in a continuance of public control, without public ownership, to which there are "good and valid objections." He will not recommend any specific bill to the General Court, but he will submit suggestions which he believes will go far toward settling the problem. On Dec. 8 he stated his opposition to any plan which would mean the return of the road to the control of its private owners, or which, on the other hand, would bring about public ownership. He said:

> I believe that in the public control of the road, without the objections of public ownership, we have the ideal situation, and if a plan is devised whereby the road can be relieved of some of the burdens which have been placed upon it, there is no reason why this situation cannot be continued, with equal justice to the stockholders and to the public.

The Governor would not say for what period of years he would favor the continuance of public control, but indicated that it might be left to run indefinitely without any fixed period being specified. He said he would be slow in proposing any long period of continuance because the future must always be uncertain. As to the rate of dividends which should be continued to stockholders, the Governor was noncommittal, but he said he believed the dividend question could be worked out satisfactorily to both stockholders and the public.

On April 26, 1927, the Massachusetts House ordered that as an aid in determining the disposition to be made of the Boston Elevated Railway and its property, including the question of extending or terminating public control, the Department of Public Utilities be directed to investigate the value for transportation purposes of the property of the company, and whether this value was more or less than the option price provided in Section 16 of Chapter 159 of the special acts of 1918, and also whether the value of the property for transportation purposes has been increased during the period of public control through expenditures from carfares and other revenue for maintenance, depreciation reserves or otherwise, and if so, how much. The department was also directed to investigate as to the reproduction value of the property of the company and to report its opinion as to the amount thereof, less a proper deduction for depreciation and obsolescence. It was also to state its opinion as to the value of the surface lines abandoned by the company.

Changes in Kansas City Board of Directors

J. K. Newman, large owner of the stock of the Kansas City Public Service Company, Kansas City, Mo., resigned Dec. 5 as a member of the board of directors at the first formal meeting of that body. His resignation is in line with his plan to place the street railway properties there under a local board of directors. His place will be filled by George G. Morris, trainman, who has been selected for the place by a vote of all the employees of the company.

The board is now composed of Peter W. Goebel, chairman; Herbert M. Woolf, James K. Chandler, Powell C. Groner, president; Carl W. Allendoerfer; Henry N. Ess; Charles Howell, Dr. Paul H. Saunders, E. M. Stayton; Henry Hanssen, Mr. Morris. Dr. Saunders is the only out-of-Kansas City member, his home being in New Orleans. He is a member of the Newman-Saunders banking firm. A budget for the coming year was placed before the board by Mr. Groner. It called for expenditures of about $3,000,000 next year.

Dissolution of Vancouver, Wash., Company Asked

A petition for an order permitting the Clark County Development Company, Vancouver, Wash., to dissolve the corporation, which was organized June 19, 1909, was filed in that city Dec. 2. This corporation operated the Vancouver street and interurban railway up to Nov. 1, 1926, when this railway was abandoned by the City Council. Thus since that time the organization has had no business to pursue. The territory in which the railway operated is now served by the Vancouver Bus Company.

Warsaw Line Would Issue Bonds

The Winona Railroad, operating between Peru and Goshen, Ind., has petitioned the Public Service Commission for authority to issue $260,000 in 6 per cent bonds. This money is desired to reimburse the company for capital expenditures since June, 1924.

Reasons for California Deal Explained

Further facts are available regarding the negotiations for the sale of the Petaluma & Santa Rosa Railroad, Petaluma, Cal., to the Southern Pacific and the Santa Fe Railroads acting jointly, to which brief reference was made in the ELECTRIC RAILWAY JOURNAL for Dec. 3, page 1042. While the companies mentioned own the Northwestern Pacific Railroad, the purchase of the Petaluma & Santa Rosa Railroad by them will not mean consolidation of the two lines, as they will continue to be operated independently. There will be no change in the management or policy of the Petaluma & Santa Rosa Railroad.

An officer of the electric railway in explaining the proposed deal made it plain to the public that the sale will simply mean a change in stock ownership, which will enable the electric railway to expand its business. It now serves, under traffic arrangements, as a feeder to both the Southern Pacific and the Santa Fe lines, and purchase by these companies will have the effect of extending these arrangements, placing them on a more permanent basis whereby more traffic can be developed.

Port Arthur Sale Date Set

Sale of the electric railway system of the Port Arthur Traction Company, Port Arthur, Tex., has been ordered by Judge W. Lee Estes of the United States District Court at Beaumont, upon petition of the Dayton Savings & Trust Company of Dayton, Ohio, for foreclosure of mortgage against the company. The date has been set for Jan. 10.

Suit for the foreclosure of mortgages amounting to $324,000 and asking the sale of the public utility was filed in the United States District Court Nov. 14. According to the petition the railway is "deteriorating so fast that it ceased to be a safe investment for its creditors."

In April, 1917, the officers of the Port Arthur Traction Company issued $400,000 in bonds for improvements and extensions and for operation and maintenance. The plaintiff alleged that only $9,000 of the original issue has been paid off and that three semi-annual allotments of interest have lapsed. In July, 1926; in January, 1927, and in July, 1927, the defendant failed to pay $8,100 interest for the semi-annual period, it is alleged. The outstanding bonds are the only indebtedness secured by lien against the company.

It is understood that the Gulf States Utility Company will enter a bid when the railway is offered at public auction.

Earnings in Youngstown Less Than Allowed Return

Including the 7 per cent return allowed on the capital investment, the Youngstown Municipal Railway, Youngstown, Ohio, operated during October at a loss of $32,505 according to Traction Commissioner Harry Engle.

This is the fourth consecutive month that the company received no return on its investment. The loss, however, is smaller than in September, when it was $37,748. The deficit for August was $27,280 and for July $27,203. Under the franchise the company was entitled to a return of $26,726.

Gross revenue for October, this year, was $158,346, compared with $176,924 for the corresponding month last year. The total mileage, including bus and railway, for October, 1927, was 477,301, compared with 483,085 for the similar month of last year. Mr. Engle's report places the total deficit in the stabilizing fund at the end of the month at $1,647,667. The earnings per car-mile are given at 32 cents and the actual cost of service at 38 cents.

1 Per Cent Bonus on Ottawa Traction Stock

The Ottawa Traction Company, Ottawa, Ont., has declared a bonus of 1 per cent on the capital stock in addition to the regular quarterly dividend of 1 per cent, both payable on Jan. 3 to stock of record Dec. 15.

Binghamton Sale Postponed

Sale of the properties of the Binghamton Railway, Binghamton, N. Y., under foreclosure set for Dec. 1, 1927, was postponed to Jan. 5, 1928. The railroad proper consists of 47.72 miles of single and double track and the equipment consists of seventeen buses and 79 cars, all in good condition.

Abandonment Sought in New Mexico

A petition was recently presented to the New Mexico Corporation Commission by the Las Vegas Transit Company seeking permission to abandon the line because of operating losses. The line operates between east and west Las Vegas, N. M The two municipalities have already approved the proposed suspension.

Pence Interests Get Minnesota Roads

H. E. Pence, president of the Minneapolis, Northfield & Southern Railway, Minneapolis, Minn., has secured control of the Minnesota Western and the Electric Short Line Terminal Company. The assets of the companies involved are put at $4,000,000. The companies will be operated separately under the management of the Minneapolis Southern. This gives the Pence line a fine electric terminal in the city, which is entered also by the Anoka electric line. The first two named roads operate gas-electric passenger trains and steam freight. They both enter the electric terminal at Third Avenue North and Seventh Street. The first line covers 127 miles and the second 116 miles to Gluek, Minn., a new station.

Verity of Commission's Valuation Not Considered in O'Fallon Case

A court specially constituted to try the issues has sustained the ruling of the Interstate Commerce Commission in the so-called St. Louis & O'Fallon Railroad recapture case. The Supreme Court of the United States will hear the appeal. The importance of the final result of the litigation may be judged by the finding of the commission that the 1914 base, which was the one the commission with certain allowances adopted by a majority opinion, gave in 1920 a value of $18,900,000,000 for all railroad properties in the United States, while the reproduction cost basis made it $41,400,000,000 in 1920 and took it back to $31,300,000,000 in 1923.

In his decision, Federal Judge Kimbrough Stone says the order of the Interstate Commerce Commission should be modified to allow interest on each of the amounts due found by the court only from June 17, 1927, and as thus modified should be sustained.

The concurrent opinion, written by District Judge Charles B. Faris, says:

In conclusion, I am not convinced that the commission erred, but am of the opinion that it reached the valuation found by it in the only way possible in a situation so difficult as that absolute certainty and correctness were well nigh finitely impossible. Therefore I concur in the result.

Judge Stone in his opinion did not touch upon the question of valuation, but Judge Faris in his opinion said:

Therefore the value of the physical property of the common carriers under the recapture provision of the interstate commerce act ought to be the result of expert opinion, reasonably and honestly exercised and informed by a consideration of the information required by statute to be obtained; as is to be deduced from a fair analysis of the items considered and of the method employed in the valuation; and should, in addition to the use in the valuation of the statutory information, take into consideration the average of known price levels for both labor and materials over a fair term of years preceding the valuation as well as for a fair term of years thereafter, based on the trend of such levels according to historical observation and human experience.

The original opinion was written by Judge Stone and the concurring opinion was prepared by Judge Faris.

In the St. Louis & O'Fallon Railroad case the commission was divided five to four. The language of the dissenters was more bitter than the protest of the railroads. Commissioner Thomas F. Woodlock of New York declared that the law of the land was summarily set aside by the majority. The Supreme Court is composed now as it was when it decided the case of McCardle vs. Indianapolis Water Company. The essence of that decision was that value should be found as at the time of the inquiry.

The opinion of the Interstate Commerce Commission on entering its decision said:

We are dealing here with one small railroad. Nevertheless, what we do in this case we must in principle do for all the railroads in the United States. Whatever our decision, its effects in dollars and cents is relatively unimportant in this particular case. There is here presented, in reality, a great national problem affecting public policy and welfare in a most profound way . . . We must carefully review the significance to the nation of the decision which we make in this case in its bearing on the relation between all railroads and the people of the United States. It may well be that the valuation of railroads on a national scale requires the beginning of a new chapter in valuation.

Vote on Increase in P. R. T. Preferred Stock Scheduled

A special meeting of the stockholders of the Philadelphia Rapid Transit Company, Philadelphia, Pa., will be held on Feb. 6 to vote on the proposed increase of $7,000,000 in preferred stock, which will make $30,000,000 preferred outstanding.

Committee Representing Omaha Holders Reviews Affairs

Affairs of the Omaha & Council Bluffs Street Railway, Omaha, Neb., have been reviewed in part as follows in a circular by the protective committee of bondholders:

As a result of careful and impartial study of the situation, the following effective measures have been or are being taken for the protection of the bondholders, viz., John N. Shannahan, an experienced railway operator, was made president of the company; (2) the financing of the Omaha & Council Bluffs Railway & Bridge Company, thus preserving the equity in this company for the benefit of the railroad company bondholders; (3) the election of representative business men of Omaha to the board; (4) agreement with the company providing (a) that no dividend shall be paid during the period of extension and (b) for the cancellation or deposit as security of the $1,005,000 bonds now held in the treasury of the company, and (5) to insure the maintenance in office of a satisfactory board of directors during the period of extension.

It is our belief that the above features greatly strengthen the position of the bondholders and that their interests will be fully and adequately protected by the committee, of which Sidney W. Noyes is chairman. We believe the proposed extension of the bonds is the only practical course for the bondholders and we therefore strongly recommend that you deposit your bonds immediately. In view of the measures adopted for the protection of bondholders, our committee will now disband and representatives of our committee will accept membership on the committee requesting deposits.

Personal Items

J. F. Lumsden New Manager of Nova Scotia Property

On the first day of the new year J. F. Lumsden will take over the management of the Nova Scotia Tramways & Power Company, Halifax, N. S. To carry out this assignment he will resign as assistant chief engineer of the Nova Scotia Power Commission, with which body he became affiliated in 1921 as chief electrical engineer.

Mr. Lumsden was first employed with the Canadian General Electric Company as an apprentice in its factory and on its engineering staff from 1911 to 1915. Early in the latter year and up to July, 1916, he served on the operating staff of the Winnipeg Electric Railway. After his overseas service with Canadian Expeditionary Forces he returned to Halifax in 1919 and took a position as professor in electrical engineering at the Nova Scotia Technical College. Two years later he went with the Nova Scotia Power Commission.

The manager-elect was born in Trinity, Newfoundland. Early in his life he moved to Nova Scotia, where he attended the high school in Yarmouth and later the Mount Allison University and the Nova Scotia Technical College. He was graduated from the latter institution with the degree of bachelor of science in electrical engineering in 1911.

W. J. Tharp Retires from Railway Work

W. J. Tharp, affiliated with the electric railway properties in Little Rock, Ark., for more than 28 years, resigned recently to become an official of Kaufman & Baer, a large department store organization in Pittsburgh. For many years Mr. Tharp was a director of the Arkansas Central Power Company and secretary of the Arkansas Utilities Association. He also served on utility association special committees. When Mr. Tharp became affiliated with the Little Rock property the system owned twelve cars and the mileage was about half what it is today. At present there are 65 cars in regular service running over 42 miles of track.

M. N. Baker Honored

M. N. Baker, associate editor of *Engineering News-Record,* was the guest of honor at a dinner given by about 100 of his associates in the McGraw-Hill company at the Engineers Club, New York City, Dec. 9, in celebration of his 40th year of continuous editorial service with *Engineering News* and *Engineering News-Record.*

Mr. Baker started in engineering journalism with *Engineering News* when Arthur M. Wellington was editor. One of his first achievements was the building up of a water-works year book, the Manual of American Water-Works, which long was a basic source of information regarding the water-works of the United States and Canada. Out of this year book grew Mr. Baker's special and editorial attention to questions of water purification, sewage and garbage disposal and other phases of public health and sanitation which were then beginning to be put on a scientific basis. He is the author of several standard engineering works.

H. L. Mitchell Honored

H. L. Mitchell, president of the West Penn Railways, Pittsburgh, Pa., was chosen to continue as president of the Pennsylvania Street Railway Association at the close of the session on Dec. 2, in Scranton, Pa. He succeeds the late Jilson J. Coleman.

H. L. Mitchell

This railway executive has been identified with the West Penn Railways and the companies which it controls for the past 25 years. During this time the property has developed into one of the most important utility systems in Pennsylvania operating railway and bus lines in the western part of that state, eastern Ohio and northern West Virginia.

Mr. Mitchell entered the employ of the old Pittsburgh, McKeesport & Connellsville Railway at Pittsburgh on March 1, 1902. Less than a year later, when the general offices of the road were moved to Connellsville, he became chief clerk to Thomas Elliot, at that time general manager. From that time until July 1, 1911, he held various positions with the company, among them those of paymaster and office manager. He also had charge of the general and district stores department.

When the West Penn System acquired additional property in Allegheny, Buffalo, Armstrong, Washington and Green Counties Mr. Mitchell was transferred to Pittsburgh as assistant to W. E. Moore, vice-president and general manager. Several years later, when the system was reorganized, he was made assistant manager of the light and power department, and in 1918 he entered the office of Williston Fish as an assistant to the vice-president. A few months later he was transferred to the Wheeling Traction Company, and on Feb. 1, 1919, returned to Pittsburgh as general manager of the West Penn Railways. Nor were his honors to stop with this promotion. He was elected vice-president on March 1, 1920, and president April 14, 1927.

Engineer Hewes Resigns from Rensselaer Property

James E. Hewes, vice-president and general manager of the Eastern New York Utilities Company, Rensselaer, N. Y., will resign Jan. 1 to specialize in the investigation of the engineering and operation of public utilities. Mr. Hewes, widely known as an engineering expert, went to the Albany Southern Railroad in 1909 in an advisory capacity soon after that company was brought out of receivership. He was appointed vice-president and general manager thirteen years ago and since that time has been the directing head of the railroad, the gas and the electric departments of the company.

In 1922 the company was succeeded by the Eastern New York Utilities Company and Mr. Hewes remained the active head of the company. Prior to his going to Albany, he was for five years assistant to the vice-president in charge of operations for H. M. Byllesby & Company, Chicago, operators and owners of public utilities. The property which Mr. Hewes leaves was merged recently with the newly formed New York Power & Light Corporation.

Because he had seen an opportunity to broaden his field of activity was the reason given by Mr. Hewes for his resignation. He plans to enter his new work when he returns from a month's vacation in Cuba.

W. H. MUNRO has resigned as manager of the Nova Scotia Tramways & Power Company, Halifax, Nova Scotia. He will be succeeded by J. F. Lumsden.

CHARLES A. BRANN has resigned as superintendent of the Eastern Texas Electric Company, Beaumont, Tex. He will be located at Navasota, Tex., in charge of properties in more than a score of communities in which the Western Public Service Company operates.

J. MCLUCIUS SNELLINGS was made general freight agent of the Augusta-Aiken Railway & Electric Corporation, Augusta, Ga., effective Sept. 1, 1927. Mr. Snellings became affiliated with the corporation as a conductor on the City Division, July, 1915, and on Oct. 1, 1916, was promoted to assistant claim agent and chief clerk of the railway department. He was given the additional duties of chief dispatcher on Feb. 18, 1924. He was also secretary of the safety organization.

Manufactures *and the* Markets

Twelve New Cars for Washington Railway

Twelve new cars, at an estimated cost of more than $174,600, have been ordered by the Washington Railway & Electric Company, Washington, D. C., from the J. G. Brill Company, according to recent advices from the company. In addition the company is equipping 41 double-truck, one-man cars with National Pneumatic Company's automatic rear exit doors and brake interlocks. With this interlocking equipment brakes cannot be released and current cannot be applied to the motors until the rear exit door and step are closed. As the cars go through the shop they are being painted royal blue and cream, with gilt lettering on the outside, and on the inside the woodwork is being painted with a light gray enamel and the headlining with white enamel. The estimated cost of this work is a little more than $47,000.

The order for the new cars and the changes in others were the outcome of an order issued by the Public Utilities Commission of the District of Columbia Sept. 8, 1927, in which it was stated that "the commission is of the opinion that as a general principle one-man cars not equipped with automatic treadle rear exits and double front doors, to permit of simultaneous entrance and exit, do not and cannot give satisfactory service for the city of Washington, D. C."

In accordance with this opinion the company agreed to equip the 41 one-man cars with automatic treadle rear exits and double front doors. At the same time it also agreed to retire from service twelve of the oldest type of one-man cars not capable of being so equipped and to replace them with an equal number of new cars of the type now in use on Wisconsin Avenue.

Let-Up in Demand Affects Metal Prices

Copper and zinc have been extremely quiet in the week ended Dec. 14. There has been some activity in lead, but the total volume of business has declined. Tin has been in fair demand.

The week ended Dec. 14 has been one of the quietest of the year so far as copper is concerned. Most of the larger producers have held throughout the week at 14⅛ cents delivered in the East and 14¼ cents in the Middle West. Copper appeared on the market as early as Saturday, however, at 14 cents delivered in the East. Foreign demand has been quiet, with the export association's price unchanged at 14.50 cents, c.i.f.

Zinc prices have gradually weakened from the level of a week ago, the net decline for the week being about ⅛ cent. Sales have been very small. On Dec. 13 and 14 the market was 5.70 cents, St. Louis, for December and 5.725 cents for January and February, though several producers refused to quote at these levels.

Lead buying has been in considerably smaller volume than during the preceding week, but aside from some slight tendency in the Middle West to shade prices in order to attract buyers, quotations are unchanged. The lead available at 6.325 cents or even 6.30 cents in the St. Louis market is for the most part for December delivery, the January position being the firmer of the two.

Consumers have been buying tin in the domestic market more actively than for several weeks, and the price has ruled close to 58.625 cents for prompt Straits, with little or no difference for forward positions.

Railway Traffic Accommodated Over Akron Viaduct

The new Exchange Street viaduct in Akron, Ohio, costing approximately $2,000,000, has been opened for railway traffic. The viaduct will not be ready for general use by the public until early next year. It spans all of the trunk line railroads entering the city and is adjacent to the site of the new Union Station, which is to be started in 1928 and built at a cost of approximately $4,000,000. The companies constructing the viaduct are the Northern Ohio Power & Light Company, Baltimore & Ohio Railroad, Erie Railroad and Pennsylvania Railroad. The city also pays its proportion. This viaduct, it is reported, is the first step in the complete grade elimination program in the city.

Queens Subway Contract Awarded

The first contract in the Borough of Queens for the construction of part of New York City's new subway system was awarded on Dec. 13 by the Board of Transportation to the Atwell-Custon-Morris Company at the bid price of $5,198,283, the lowest of twenty bids received. The contract is for a section 1 mile long. Its construction will serve to connect the Queens Boulevard-Jamaica subway and the Brooklyn cross-town subway, still to be built, with the 53d Street tunnel line from Manhattan. Completion of the section is stipulated within three years from the date of delivery of the contract. This is the 33d major contract of the new subway system to be awarded and brings the total awards to $171,595,561.

The board will receive bids for the construction of two more sections of the Brooklyn crosstown subway this month. On Dec. 30 it will receive bids for the section in Manhattan Avenue from Nassau Avenue to Green Street, and on Dec. 31 for the section in Greenpoint to Arch Street, Long Island City.

Carhouse of Ohio Road Burned

Fire of undetermined origin destroyed the carhouse of the Columbus, Delaware & Marion Electric Company at Stratford, 3 miles south of Delaware, Ohio, on Dec. 15, the loss being estimated at several hundred thousand dollars.

ELECTRIC RAILWAY MATERIAL PRICES—DEC. 13, 1927

Metals—New York

Copper, electrolytic, cents per lb.	13.850
Lead, cents per lb.	6.50
Nickel, cents per lb.	35.00
Zinc, cents per lb.	6.0625
Tin, Straits, cents per lb.	58.625
Aluminum, 98 or 99 per cent, cents per lb.	25.00
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	61.00
General service	31.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$4.075
Somerset mine run, Boston	1.90
Pittsburgh mine run, Pittsburgh	1.825
Franklin, Ill., screenings, Chicago	1.60
Central, Ill., screenings, Chicago	1.50
Kansas screenings, Kansas City	2.175

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅝ in. and larger, cents per lb.	2.80
Tie plates (flat type), cents per lb.	2.25
Angle bars, cents per lb.	2.75
Rail bolts and nuts, cents per lb.	3.90
Steel bars, cents per lb.	1.80
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.50
Sheet iron (24 gage), cents per lb.	2.75
Sheet iron, galvanized (24 gage), cents per lb.	3.60
Galvanized barbed wire, cents per lb.	3.20
Galvanized wire, ordinary, cents per lb.	2.40

Waste—New York

Waste, wool, cents per lb.	16–20
Waste, cotton (100 lb. bale), cents per lb.:	
White	16–19.50
Colored	11-16

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	10.6
White lead in oil (100 lb. keg), cents per lb.	13.25
Turpentine (bbl. lots), per gal.	$0.59
Putty, 100 lb. tins, cents per lb.	5.25–5.50

Wire—New York

Copper wire, cents per lb.	15.125
Rubber-covered wire, No. 14, per 1,000 ft.	5.50
Weatherproof wire base, cents per lb.	15.75

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.85
Cement, Chicago consumers' net prices, without bags	2.05
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., f.o.b. N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	11.375
Light copper, cents per lb.	9.875
Heavy yellow brass, cents per lb.	7.375
Zinc, old scrap, cents per lb.	3.625
Lead, cents per lb. (heavy)	5.375
Steel car axles, Chicago, net ton	$15.75
Cast iron car wheels, Chicago, gross ton	13.75
Rails (short), Chicago, gross ton	14.75
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.75

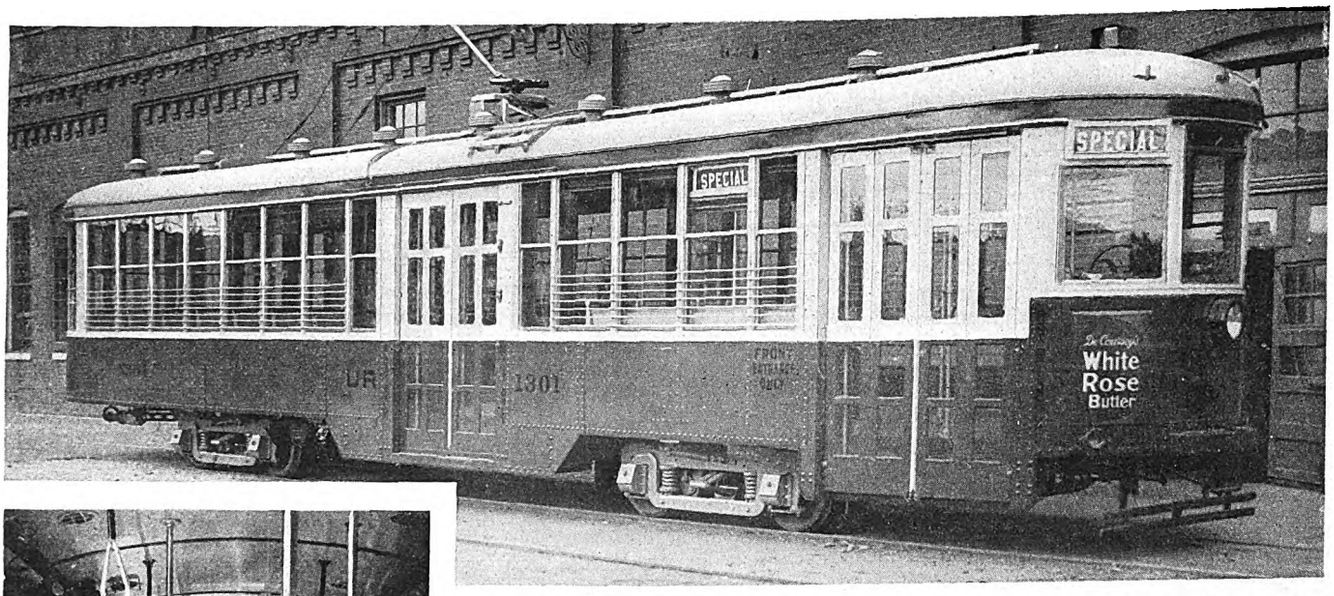
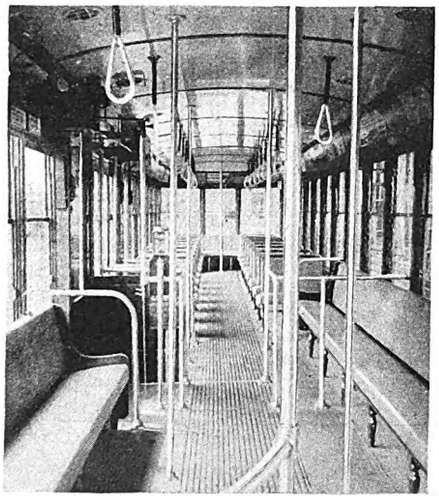
First Home-Built Car Exhibited by St. Louis Railway



Side elevation of the 50 St. Louis units. They are of the front-entrance, side-exit type and are adaptable to one-man operation



Rear view of interior of the 50 new units which are now being turned out from a shop of the Public Service Company of St. Louis

CAR No. 1301, the first of 50 new units now being built by the St. Louis Public Service Company of St. Louis, Mo., at a cost of $10,500 each, was placed on public exhibition at Twelfth Boulevard and Olive Street recently. The units are to be of the front-entrance side-exit type which originated with car No. 700.

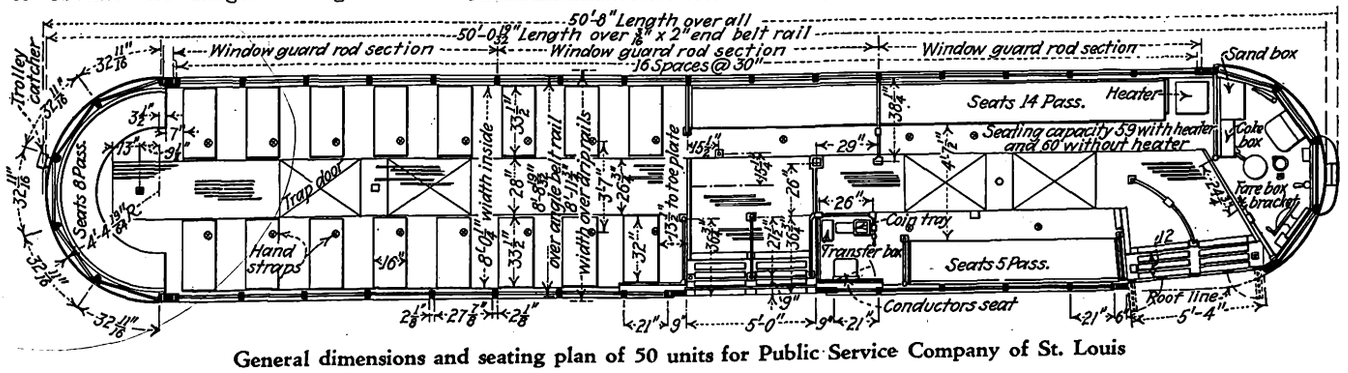
Among other things the specifications call for a slight incline to the floor from the front entrance to the conductor's stand; narrower grooves in the flooring to obviate the danger to high heeled feminine passengers; elimination of screen behind the motorman's stool to increase vision and ventilation; readily adjustable window sashes of metal and better door signal lights for the motorman. The seat upholstery is of cane.

The orange coloring so familiar to street car riders of St. Louis, but of a shade darker than now in use, has been chosen for the lower portions of the units, while the upper sections are finished in a rich cream color. The inside painting will consist of cream ceilings that reflect the light and contrasts effectively with the interior cherry trim.

Following are specifications released by R. J. Lockwood, assistant manager of the company:

SPECIFICATIONS OF ST. LOUIS' HOME-BUILT CAR

Name of railway	St. Louis Public Service Co.
City and state	St. Louis, Mo.
Number of units	50
Type of unit	One-man, two-man, motor, passenger, city, single-end, double-truck
Number of seats	60
Builder of car body	United Rwys. of St. Louis
City and state	St. Louis, Mo.
Delivery	15 per month
Weights:	
Car body	20,986 lb.
Trucks	10,414 lb.
Equipment	8,000 lb.
Total	39,400 lb.
Bolster centers	24 ft. 6 in.
Length over all	50 ft. 8 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 11¼ in.
Height, rail to trolley base	11 ft. 11 in.
Window post spacing	30 in.
Body	Semi-steel
Roof	Arch
Air brakes	Westinghouse variable load straight air
Armature bearings	Plain
Axles	3¼ x 7 M.C.B. journal
Car signal system	Faraday
Compressors	Westinghouse D.H-16
Conduit	Metal
Control	K-75
Curtain fixtures	Curtain Supply Co.
Curtain material	Wyndasote
Destination signs	Hunter
Door mechanism	National Pneumatic Co.
Doors	Folding front, sliding center
Energy-saving device	Economy
Fare boxes	Johnson
Gears and pinions	Westinghouse spur
Glass	D.S.B.
Hand brakes	Peacock
Hand straps	Central Equipment Co.
Heaters	Peter Smith hot air
Headlights	Imperial incandescent, Crouse-Hinds
Headlining	Agasote, Pantasote Co.
Interior trim	Cherry
Journal bearings	Plain, 3¼ in. x 7 in.
Journal boxes	A.E.R.A. type with thrust plate
Lamp fixtures	General Electric
Motors	Westinghouse No. 510-E, inside hung
Painting scheme	Orange, chrome and cream enamel
Registers	Security
Roof material	Treated canvas
Sash fixtures	O. M. Edwards Co.
Seats	St. Louis Car Co.
Seat spacing	30 in.
Seating material	Cane
Steps	Stationary
Step treads	Feralun
Trolley catchers	Ohio Brass
Trolley base	Nuttall U. S. No. 20-A
Trolley wheels	Railway
Trucks	Commonwealth Steel Co.
Ventilators	Globe
Wheels, type	Chilled iron, 26 in. diameter
Wheelguards or fenders	Company make



General dimensions and seating plan of 50 units for Public Service Company of St. Louis

Receiver Named for the Galena-Signal Oil of Texas

On the application of the Galena-Signal Oil Company, Franklin, Pa., Judge Monteith in the 61st District Court appointed McDonald Meachum of Houston, Tex., receiver Dec. 8 of the Galena-Signal Oil Company of Texas, whose refinery and principal properties are in Houston. The Houston company is a subsidiary of the Pennsylvania company. The Fidelity Trust Company, Houston, is made a party to the suit because it is the trustee for the bondholders. M. J. A. Bertin, president of the Pennsylvania company, said the action had been rendered necessary by the depressed state of the oil business throughout the country. He stated that "although the Galena-Signal Oil Company of Pennsylvania, through ownership of capital stock of the Galena-Signal Oil Company of Texas, has a considerable investment in the latter company, the operations of the two companies has been along distinctly different lines and the receivership in no way affects the operating program of the Pennsylvania company, which will continue, as in the past, along lines of specialization in the field of railway transportation and mechanical lubrication."

Twenty Rapid Transit Cars for Hudson & Manhattan

Specifications have been released for the twenty rapid transit motor cars ordered on Nov. 17 by the Hudson & Manhattan Railroad, New York, from the American Car & Foundry Company, New York, and which were mentioned in the issue of the JOURNAL for Dec. 3. The cars will have an over-all length of 51 ft., total weight of 74,000 lb., a seating capacity for 44 passengers, and will be of all-steel construction. The exterior color of the cars will be Pullman green. Specifications released by T. G. Anthony, assistant to president Hudson & Manhattan Railroad, follow:

Name of railway	Hudson & Manhattan Railroad
City and State	New York, N. Y.
Number of units	20
Type of car	Multiple unit, motor, passenger, interurban, double-end, double-truck
Number of seats	44
Builder of car body	American Car & Foundry Co., New York City
Date of order	Nov. 17, 1927
Weights:	
Car body	35,100 lb.
Trucks	24,340 lb.
Equipment	14,560 lb.
Total	74,000 lb.
Bolster centers	33 ft. 0 in.
Length over all	51 ft. 0 in.
Truck wheelbase	6 ft. 6 in.
Width over all	8 ft. 11 in.
Height, rail to trolley base	11 ft. 9 in.
Body	All steel
Roof	Monitor
Doors	Center and end
Air brakes	Westinghouse
Armature bearings	Plain
Axles	Heat treated
Car signal system	National Pneumatic
Compressors	Westinghouse
Conduit	Metal
Control	General Electric PC
Couplers	Van Dorn
Destination signs	Hunter
Door mechanism	Pneumatic
Doors	Sliding
Finish	Semi-enamel
Floor covering	Magnesite
Gears and pinions	Heat treated
Glass	Plate
Hand brakes	Adams-Westlake
Headlining	Steel
Interior trim	Steel
Journal bearings	Plain
Journal boxes	Symington
Lamp fixtures	Special
Motors	Two General Electric, No. 259A, inside hung
Painting scheme	Pullman green
Roof type	Monitor
Roof material	Steel
Sash fixtures	Brass
Seating material	Rattan
Slack adjusters	Westinghouse
Trucks	A. C. & F.
Ventilators	Perry
Wheels, type	Steel tired, 30- and 33-in. diameter

ROLLING STOCK

CLEVELAND SOUTHWESTERN RAILWAY & LIGHT COMPANY, Cleveland, Ohio, has announced the purchase of four new buses in furtherance of its plan to coordinate railway and bus service. These buses, of the latest type and design, consist of White motors and chassis with Bender bodies. They are of battleship gray with nickel-trimmed rear and spacious observation platforms. In addition each seat has individual lighting. Each bus is equipped with non-shatterable glass.

BOSTON ELEVATED RAILWAY, Boston, Mass., has recently ordered a White six-cylinder bus, Model 54.

ALABAMA POWER COMPANY, Birmingham, Ala., reported recently that it was buying two center-entrance type cars from the South Carolina Power Company, Charleston, S. C., for the Gadsen street railway system. The plan was to remodel the bodies in order to provide front entrances and to equip the center doors with treadle devices so they could be used as exits. These double-truck cars are modern in every way and are to replace obsolete equipment in operation in Gadsen.

COUNTY TRANSPORTATION COMPANY, bus operating subsidiary of the New York, Westchester & Boston Railway, has accepted delivery on eighteen 29-passenger Mack city type buses, AB model, four-cylinder, 225-in. wheelbase. This delivery brings the total fleet to 50 Macks.

TRACK AND LINE

TULSA STREET RAILWAY, Tulsa, Okla., has started a $75,000 improvement program. Removal of all joints in the tracks through a process of thermit welding is planned. Twelve miles of track will be relaid and 6 miles will undergo minor improvements. All trackwork is being done between midnight and 6 a.m., while tracks are free from use.

SHOPS AND BUILDINGS

WISCONSIN POWER & LIGHT COMPANY, Madison, Wis., is reported, as proposing a union bus terminal for Madison. The company has purchased property, at a cost of about $150,000, in the heart of the downtown business district, recent advices state, on which it proposes to erect early next year a ten-story office building with an adjoining two-story bus terminal. Tentative plans for both structures have been drawn by architects.

PHILADELPHIA RAPID TRANSIT COMPANY, Philadelphia, Pa., in submitting its financial program for 1928 to the Council, has included liberal allowances for expenditures to various departments. On general shop enlargement and increasing maintenance facilities, the communication stated the sum of $2,000,000 is to be spent. These improvements will affect electric substation equipment. In addition, $175,000 is to be expended on the substation at Third Street and Wyoming Avenue, $450,000 on the substation at 33d and Market Streets and $66,000 on additional rotary-Letterley substations.

ADVERTISING LITERATURE

OHIO BRASS COMPANY, Mansfield, Ohio, has recently published a booklet entitled "Lead Tip Steel Pins for Insulators." The booklet contains sixteen pages in colors with an artistic cover. It treats of the importance of the pin to the insulator, placing particular emphasis on the necessity for proper pin selection to provide the most efficient insulator service. O-B pins, according to the publication, are all knurled and hot dipped galvanized before the lead is specially applied to insure a permanent bond so that the lead does not come loose on the pin. The booklet also describes and lists other O-B products and may be had upon request.

ECONOMY ELECTRIC DEVICES COMPANY, Chicago, Ill., is distributing a reprint of a double-page advertisement of its electric railway and gasoline vehicle meters which appeared in the ELECTRIC RAILWAY JOURNAL of Oct. 8.

CONDIT ELECTRICAL MANUFACTURING CORPORATION, Boston, Mass., has issued a mailing folder descriptive of its switchboards, in which it emphasizes the careful testing they undergo and that "they must be correct to the last detail.

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY, East Pittsburgh, Pa., has issued circular 1793 in booklet form devoted to a discussion of the application of automatic switching to railway use. The circular is entitled Automatic Railway Substations. It is illustrated and is divided into six sections. They advise that the circular may be obtained at any of the district offices of the Westinghouse company or at the advertising division at East Pittsburgh, Pa.

ALEXANDER MILBURN COMPANY, Baltimore, Md., is mailing looseleaf bulletins B-200 C and B-200 D, illustrating and describing its acetylene generators and its die burners and preheaters.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has issued an attractive folder, GEK-37, describing its gas-electric drive for buses.

1928 Convention Goes to Cleveland

ACTION of the policy committee in again selecting Cleveland as the location for the American Electric Railway Association convention, which will be held next fall during the week of Sept. 22-28, may at first be received with some surprise by those who have looked forward to the attractions of Atlantic City as a convention location. Executives who sense the industry's needs will after mature deliberation see the problem of convention location in proper perspective. This should quickly bring widespread approval of the policy committee's judgment and of its courage in acting for what it considered the industry's best interests despite the general popularity of Atlantic City.

There are some, of course, who look upon a convention primarily as an outing; as merely an opportunity to get away from the routine of transportation duties. To them the attractions of Atlantic City are particularly appealing. This is not to say that the social side of a convention, the opportunity for renewing acquaintances and for good fellowship, is not an important phase of an industry's annual meeting. But it is not the most important phase. The serious business of the industry, the study of progress made by other properties, the inspection of developments in equipment and apparatus, the comparison of one's own operating experience with that of others and the acquisition of new ideas should take precedence over all other considerations.

This was the view which dictated the committee's final selection. It was taken only after a careful survey of the industry. The preferences of a large number of railway men from various parts of the country were sounded in advance, and although there existed a considerable sentiment in favor of Atlantic City, it must be remembered that this was expressed without a full knowledge of the situation faced by the several committees which have been studying the matter of location of the 1928 convention.

There was a grave question as to whether the new hall in Atlantic City would be completed in time. A convention in Atlantic City without the completion of this new hall would have been disastrous from the standpoint of continuing the progress made at the last Cleveland meeting. In view of this question about the availability of adequate facilities in Atlantic City, the committee acted wisely in not jeopardizing the success of the convention and the continued progress of the industry by committing the association to the Atlantic City location.

At this critical period in the industry's history an adequate exhibit of cars and car equipment is of paramount importance. At the last convention more progress in this direction was evidenced than at any former similar meeting. As a result, many properties are now seriously studying the possibilities for improving cars to meet present-day transportation standards and traffic conditions. A large number of experimental designs are in progress or are contemplated. This development work is costly both to manufacturers and operators. It seemed therefore extremely important that adequate facilities be provided to give the industry the opportunity of capitalizing to the maximum on this forward-looking work. It is significant that of the manufacturers who expressed themselves regarding this year's convention location, those representing the largest proportion of the total space occupied, were in favor of Cleveland.

Additions to the Cleveland Public Auditorium, which were in progress last October, will be completed shortly and will be available for improved meeting rooms and even better exhibit facilities than those available last fall. The committee's decision represents the mature judgment of men who had the industry's best interests at heart and who reached a conclusion only after the most careful study of all of the factors involved. Their action, therefore, deserves the active indorsement and support of every executive who senses the industry's need at this time.

Echoing the Christmas Message

NO MATTER what our individual conception of the symbolism of Christmas, its message of "Peace on Earth, Good Will Toward Men" strikes a responsive chord in the heart of every man, regardless of creed. It is that chord, attuned to the reception of a sentiment higher than self-preservation and material progress, that constantly throughout the ages has urged man toward higher things.

Surely the message from the humble man of Nazareth has a place in industry. When recognized, it transforms a workaday world with inspiration and romance. Back of the machine that multiplies the work of human hands a thousandfold shines the inspired soul of its designer. Back of the corporation that unites the forces of production and distribution into an intricate and marvelous organization is the heart and brain of a man who has sacrificed leisure and peace of mind on the altar of service and progress.

In the ranks of the transportation industry the message of peace, service and good will has a particularly deep significance. Here romance throbs for every worker whose heart is in the job and who lifts his eyes above the daily task to see the ideals of the organization of which he is a part. On one man's alert watchfulness and devotion to duty sometimes depend the safety and comfort of thousands who intrust themselves and those they love to their public transportation company. On the tap of a hammer, the throwing of a switch, the twist of the wrench of a pipeworker or the bar of the trackman may depend the lives of men, women and children.

Watch a line gang at work in howling storm and darkness! Watch the snow crews on sweeper and plow through the long hours of a driving blizzard! Watch a motorman operate his car safely through the maze of

Digitized by Google

modern city traffic, or the conductor leave his post to extend a helping hand to aged or infirm. Here, indeed, is good will toward men!

Despite many hardships, unfair treatment and public misunderstanding, the local transportation industry bends with renewed energy to its duty of transporting daily the thousands who must be carried between their homes and offices or factories. Back of it all is the spirit of public service. In the performance of the men who devote their lives to this task, from president to the humblest trackworker, there is opportunity daily throughout the year to reflect the message that Christmas brings.

Signs and Countersigns

EUROPEAN practice in the methods of marking cars and car stops is far in advance of that in America. Here the companies which go farthest in indicating the stopping points of their cars carry a lettered enameled sign on the span wire or suspended from a bracket on a trolley pole, the sign reading "Cars stop here," or having words of similar meaning. A less effective, although more common, method is to paint on the span wire pole a white band, which may indicate a car stop to some people, but nothing to others. Still other companies do not mark their stops at all, though their cars sometimes stop to receive and discharge passengers at the near corner and sometimes at the far corner.

European practice begins where American practice ends. The companies in Europe which pay the least attention to marking stop points use the lettered signs. Most companies add to this sign the numbers of the car routes which pass that point. Many augment this information by giving also the terminals of these routes. Some include a time-table. In a number of cities the stop signs are arranged so that they are illuminated at night.

European roads lead most of those in America also in the matter of signing their cars and giving the public information about routes and schedules. They indicate the routes not only on the front of the car but at the sides, in wording which can be read a considerable distance away, and they illuminate these signs so that they can be seen at night. An account of European practice in all of these particulars is given in an article elsewhere in this issue entitled "Answering Questions Before They Are Asked."

Much thought has been given in this country to the merchandising of transportation, but advertising the serice is only part of the task of attracting and retaining patronage. Railway companies should make it easy for the passenger to find the car he wants to use and be sure that it is going where he wants to go. Otherwise, their attitude would be like that of a merchant who urges customers to come to his store, but does not tell them where it is, and when they get there, largely by chance, he refuses to inform them where he keeps the goods they want to buy.

The importance which the London Underground Combine attaches to the subject of proper station, car and bus signs is shown by its employment of one official who does nothing but determine what improvements can be made in these signs, i.e., in their design, location and wording. Here is a suggestion from England worthy of adoption here, Mayor Thompson of Chicago to the contrary notwithstanding. He thinks that English ideas should be kept out of this country, but this one might be smuggled in to the advantage of all concerned, and there are other European ideas just as good from which our railways can profit.

It is strange that so many railway companies in America should not have done more in this respect. In other lines of business signs are used extensively. One cannot take an automobile tour, even in the most unsettled parts of the country, without being told at almost every turn about the merits of various tires, hotels and department stores. Some of these display signs, especially in scenic resorts, are so obtrusive as to violate good taste. At every crossroad, also, he will find direction signs put up by automobile clubs, the state authorities or the federal government. But in street railway practice it almost appears that an intending passenger must exercise second sight or exchange signals with the motorman of an approaching car before being sure where it will stop or if it is the one he wishes to board.

It seems at times as if some companies took for their motto the verse from Scripture: "A wicked and adulterous generation seeketh after a sign; and there shall no sign be given to it." If so, they should read further in the same authority and they will learn that signs come from heaven to aid the helpless, weak and ignorant. If more transportation managers would put themselves in the position of car riders, they would soon realize the questions which intending passengers are forced to ask of passers-by because they cannot learn what they want to know from the company itself. These questions should be answered before the passenger asks them, or he will be tempted to use a taxicab or walk.

Concerted Effort Needed for Traffic Relief

CONGESTION of traffic in most large cities continues to grow unchecked. Sporadic attempts to bring some measure of relief by cut-and-try and hit-or-miss methods prove ineffective or are quickly outgrown. Figuratively speaking this tangle and snarl of interfering traffic makes of our city streets a modern Babel which threatens to defeat man's ambition by self-created confusion and lost motion.

It seems to be generally accepted that the situation is growing progressively worse. Among those directly engaged in the effort to bring about relief there is also the conviction that overlapping and duplication of the several bureaus, commissions and private agencies which exist in some communities, and which are invested with varying degrees of power, result in conflicting effort, wasted energy and, in some instances, serious waste of public funds.

Frequently the board of aldermen or the city council employs a traffic engineer working directly under that body's authority and direction. There also may be a city planning commission created by ordinance and invested with broad powers. Such a body is inevitably engaged in preparing plans and in making recommendations that vitally affect both present and future traffic conditions. One finds also, in several cities, a rapid transit commission, whose studies and recommendations are inextricably tied up with the work of the preceding groups. There may be in this same city a transportation commissioner or supervisor who regulates the operation of public transportation agencies, the movement of whose vehicles is a part of the general traffic problem. There may be, also, a traffic division of the police department. In several instances such a department, finding itself

Digitized by Google

unable to enforce the traffic regulations recommended by others, undertakes itself to study the problem and to make recommendations for bringing about relief.

So much for government bureaus and departments. Next come the efforts by more or less public-spirited citizens and organizations to aid in bringing about relief. The merchants' association decides to do something about traffic congestion, and if it is aggressive it may hire an engineer to study the situation and make recommendations for improvement of conditions. The automobile club has an interest in the subject and it also starts out to suggest measures for relief, and sometimes carries this on to an active campaign in support of its ideas. And so on *ad infinitum*. The larger the city and the more complex the problem the more agencies one finds advancing suggestions and insisting on the adoption of pet measures.

It needs but casual consideration of this situation to find a basic reason for the lack of progress toward a satisfactory, community-wide policy and plan for relief. Most measures that are adopted are mere expedients to satisfy the popular clamor for action. Until the many government and private groups find some means of pooling their activities in a central planning, transportation and traffic body, with ample funds and power to proceed effectively toward the development of definite policies and a comprehensive plan, there can be little hope of progress toward substantial and permanent relief from present conditions.

Financing on Favorable Terms by Twin City Company

NO SINGLE piece of financing done by an electric railway this year exceeds in interest the offering just made by the Twin City Rapid Transit Company, Minneapolis, of $18,000,000 first lien and refunding 5½ per cent gold bonds at a price to yield the investor more than 5.70 per cent. In some respects it is a criterion as to what other companies similarly situated may be able to do, but it is not desirable to carry the analogy too far. The company has not been without its problems in the past, serious problems at that, but most of the elements affecting it are favorable to successful results in the future. Operation is under indeterminate permits, valuations have been fixed upon which the company is permitted to earn an adequate return, and railway, bus and taxi operation are co-ordinated in the Twin Cities. Cash dividends have been paid on the common stock since 1899.

The accomplishments of the company are self-evident. Of greater interest just now is the purpose behind the present financing. In some respects the issue is in line with the recommendations of the committee on finance of the American Electric Railway Association. As President Lowry has said, the program now adopted will make possible the refunding of all existing debt as it matures and provide complete separation of the bonded debt of the St. Paul City Railway and the Minneapolis Street Railway, the principal constituents of the Twin City Company. The terms of the indenture securing the bonds are of interest because of the provision for the issue of additional bonds, particularly for refunding of obligations of the St. Paul City Railway maturing in 1932, 1934 and 1937. So far as the present offering of $18,000,000 is concerned, of the proceeds $15,000,000 and interest accrued to dates of maturity will be deposited with the trustee to retire $15,000,000 principal amount of funded debt of the pledging subsidiaries maturing Aug. 15 and Oct. 1 next, and the rest to pay for capital additions and other corporate purposes. In short, the Twin City offering is a large issue placed at favorable terms at a time of easy money that appears to afford the company ample ways in which to meet its future maturities and its capital requirements.

What Is Ahead for the Boston "L"

SIGNS all point to the settlement of the problem of the future of the Boston Elevated Railway at the coming session of the Massachusetts Legislature. Just what will be done, however, remains a mystery. The state body may adopted the Harriman plan, which called for the organization of a new company backed by state credit to carry out a comprehensive metropolitan transit plan. It may adopt the plan of Senator Warren for an extension of the present period of public control and private operation. It may adopt the Eliot Wadsworth demand for a return of the road to private control. If the Legislature does nothing about the matter, and that seems very unlikely, the road would at the end of the period of public control revert to the board of directors, who might continue to operate it on the service-at-cost plan and pay dividends at prescribed rates.

In any event two recent occurrences will tend to shape the future. These are the advisory opinion by the Supreme Court replying to the intricate questions of law raised in the Legislature last April with regard to pending plans for the road's reorganization and the more recent report by the Department of Public Utilities which places the reproduction cost of the Elevated at $188,016,892, the transportation value at $118,837,253 and the book value at $109,103,445. This last report, referred to in the JOURNAL for Dec. 17, is of particular interest. It fixes the option price of about $109,000,000 secured to the Commonwealth by the Act of 1918 under which the road is now run at about $10,000,000 less than the direct going value determined by the Department of Public Utilities and at $20,000,000 less than the conservative net value found by subtracting depreciation from the full reproduction cost. The report by the state commission certainly substantiates the statement, repeatedly made, that the railway represented an honest investment under public supervision that had prevented excessive issues of stock or bonds.

It is impossible to refer here to all the factors in the situation or to consider their intricacies. As indicated previously, the disposition of the matter rests with that unknown quantity the State Legislature. If the Governor has his way there will be no exercise by the state of its right to take over the road. He believes that the situation is one which gives the state a distinct advantage but that the solution of the Elevated problem lies in a continuation of public control without public ownership.

The present plan was adopted almost ten years ago at a time the struggle of the management to provide service for a 5-cent fare had brought about suspension of dividends and depreciation of property. It has worked well. At that time the problem was to secure the continuance of the service in an adequate manner. The public control act achieved that end. There would appear to be no reason why the present plan should not be continued with such changes and modifications in it as the working of the original act has shown would be advantageous.

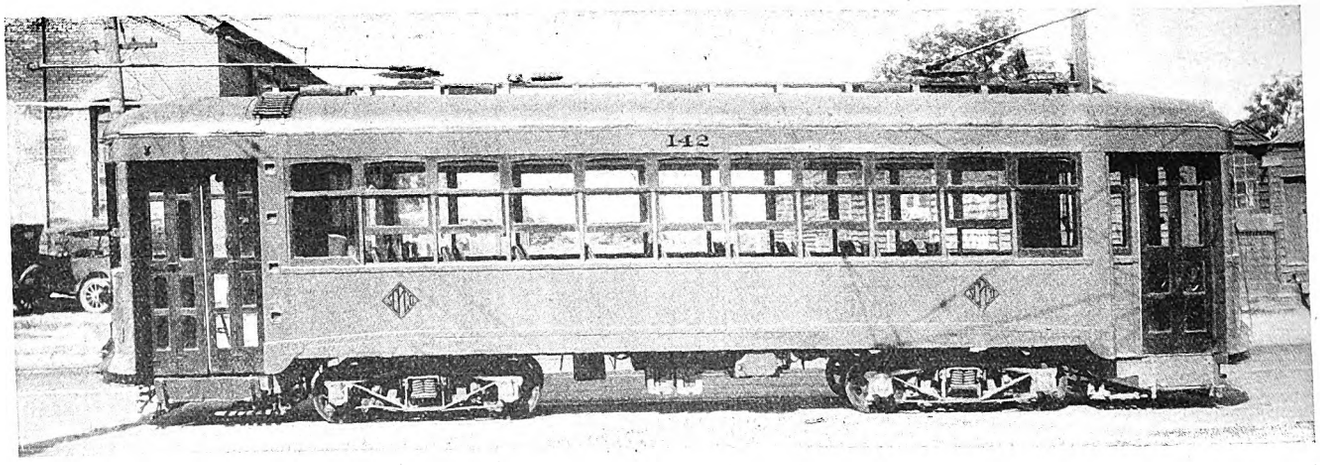
Saving a Small System

Complete rehabilitation of cars and track, reorganizing departments and systematizing shop practice have reduced operating costs materially and put the railway on a paying basis

By *Horatio Bigelow*
Superintendent of Railway South Carolina Power Company, Charleston, S. C.



The rebuilt double-truck cars are very attractive and are economical to operate

WHAT can be done to solve the problem of reducing operating costs and putting a comparatively small road on a paying basis is afforded in the experience of the railway system of the South Carolina Power Company at Charleston. A complete rehabilitation program involving the remodeling of many old cars and the purchase of several new, improved, Birney-type safety cars along with reorganizing the personnel, studying traffic problems and accident reduction, selling rides by advertising, effecting economies in several departments and systematizing the entire shop organization and practices made a new road of this street railway.

Co-operation of Men and Management Secured

Not long ago a state of armed neutrality prevailed between the man and the management. As often happens, the trainmen and shed force were continually at odds. Today they are pulling together and men and management are a 100 per cent unit combined to finish the job of saving the railway. Teamwork, without which results could never have been obtained, is now evident in every department. Each man has been sold on the possibilities and responsibilities of his job. Every employee has been brought to realize that advancement or failure depended on his own individual record, and if given sufficient rope the undesirable elements hung themselves.

Close contact with the trainmen was maintained by monthly meetings with their committee and on their invitation by regular talks before the monthly meetings of their local. Frequent talks with the shed force also kept up their interest. At these meetings, employees were posted frankly as to conditions in the railway department, insuring their utmost efforts to maintain their jobs and, incidentally, to help save the situation. Courses in "Public Utility Economics" and "Electric Railway Transportation" besides putting men in line for promotion made them supporters of the management through a better understanding of the business.

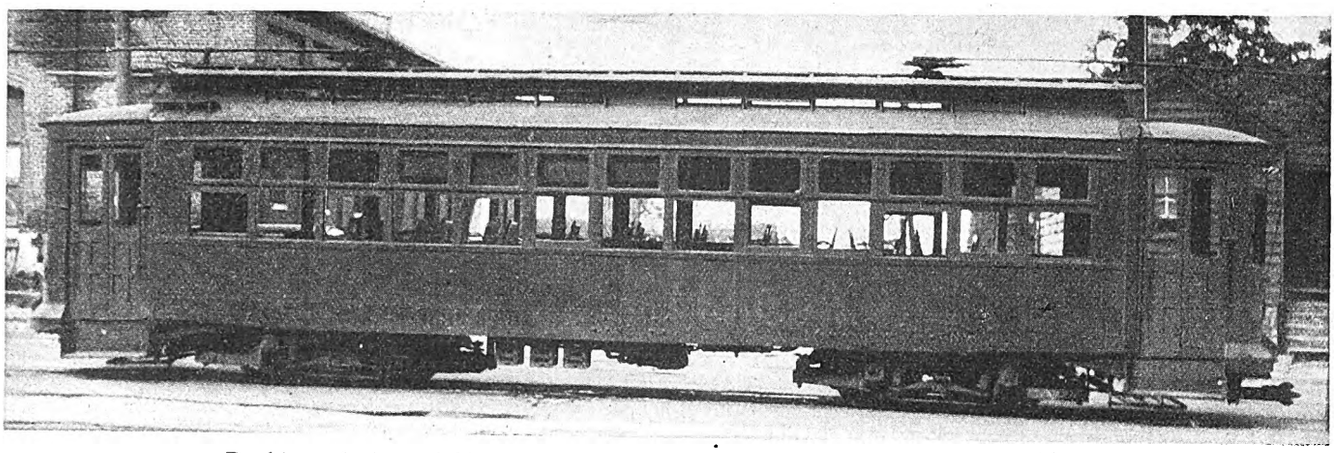
Influence of Unified Organization Far-Reaching

The unified railway organization had a far-reaching influence. Average schedule speed of the system was increased 20 per cent, from 7.5 m.p.h. in 1923 to 9 m.p.h. at present, despite an increase of 40 per cent in one-man car operation and a considerable increase in traffic congestion due to the doubling of the number of automobiles during the period. In 1923, 77 per cent of the cars operating were "on time." The last traffic check showed that 95 per cent of the cars operated were on schedule. The trainmen at first viewed the new and faster schedules with consternation and said, "They can't be maintained." It was pointed out that such schedules were being maintained on comparable systems, and that the men's jobs might hinge upon the solution of the problem. The problem was solved.

The management did its share to help the trainmen in their efforts. Careful and constant checking of schedule maintenance by the supervisory force was a big help, as was the elimination of unnecessary stops. A third was the relocation of turnouts. Also, by co-operation with the steam railroads delays at grade crossings were reduced to a minimum.

Five different types of cars were in use in 1923. Most of them were too large, not suited for one-man operation and expensive to operate. By remodeling several of the cars for one-man operation, purchasing new, improved-type Birney safety cars, adding some double-truck cars in good condition and retiring the obsolete

Digitized by Google



Double-truck cars weighing 23 tons and costing 2.25 cents per car-mile for maintenance were retired from service

cars the company was able to reduce operating and maintenance costs to a minimum. At the same time the service was made more attractive to the patrons. Full details of this car rehabilitation program were contained in an article appearing in the Sept. 17 issue of this paper, page 489.

When the city launched an extensive paving program requiring four years for completion the railway laid plans for reconstructing its tracks. The smooth track made possible the extensive operation of single-truck cars. A program of rerouting to avoid duplication of service was carried out and unnecessary track was abandoned. Single track was substituted on some lines that did not warrant a double track.

Traffic Situation Alleviated

Charleston, with its narrow main thoroughfares, is not free from traffic problems. Through co-operation between the management of the railway and the police department however, the situation has been alleviated considerably. Convictions for parking automobiles improperly were increased 600 per cent. The increase in schedule speeds also bespeaks the work of the two bodies.

Accidents have been reduced 50 per cent during the period under consideration. The campaign to this end was begun with a "Trainmen's Bulletin," setting forth the total cost of claims filed against the railway and showing that immediate action was necessary to remedy the critical condition. This was followed, at the trainmen's invitation, by a series of talks on accident prevention before their local. A graphic "Trainmen's Accident Record" was maintained in the dispatcher's office giving names, badge numbers, dates and classification of accidents. Each trainman who worked twelve months without an accident was given a gold safety button. In training new men, special care was taken to show them the quickest method of making emergency stops.

In any accident where a question arose as to the trainman's liability, he was summoned to the superintendent's office for a review of the circumstances and advised how to prevent a similar accident. In many minor accidents where the trainman was clearly at fault he was required to pay personally for the damage if he desired to retain his position. If a man's accident record showed that he could not, or would not, improve in this respect he was dropped.

Advertising and Selling Rides

In 1923 an advertising campaign set forth the benefits to be gained by patronizing the railway. Figures showing the condition of the system and that the public could buy street car service for $1 which cost $1.25 to produce were effective.

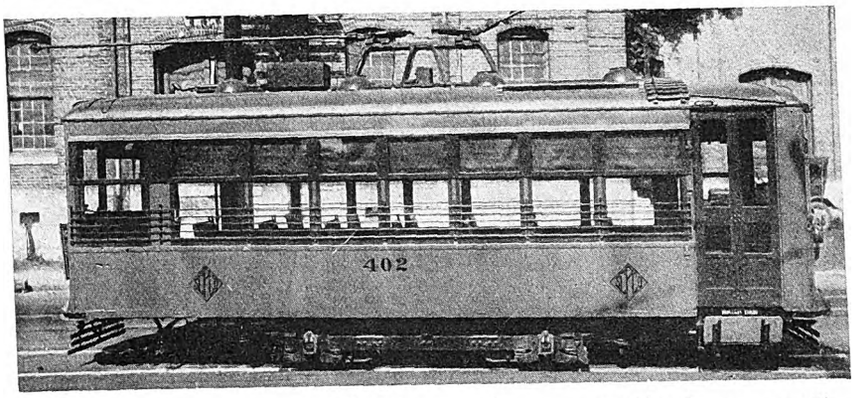
When the railway prepared its program of car and track rehabilitation, a thorough knowledge of the company's predicament was told by its advertisements. Because the city administration knew the facts no opposition to the plan was voiced. Again when the railway company petititioned the city for abatement of paving charges little argument was necessary, for the company's frank publicity already had presented its case.

"Giving the public somewhere to go," was the theme

Removing track on Bay Street, using concrete breakers to remove sections of old pavement

Street and track improvement on Meeting Street, showing the west half completed

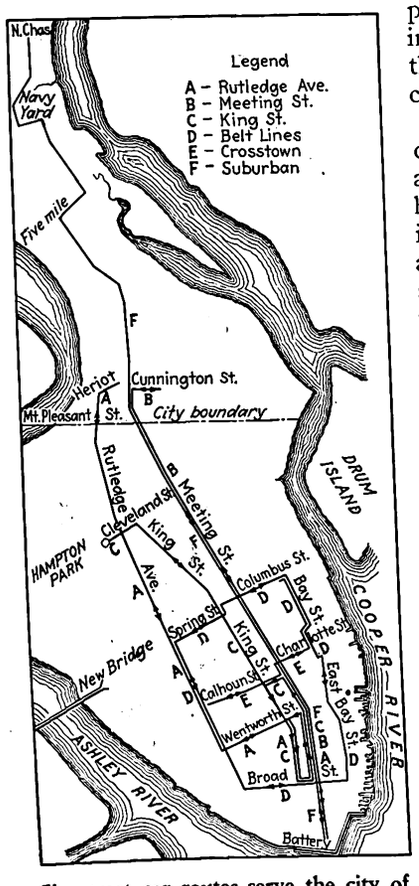
Digitized by Google



Improved Birney-type cars weigh but 6 tons and consume 1.10 kw.-hr. per car-mile, a saving of 0.92 kw.-hr. over the old cars

of a plan to increase riding. For example, for the colored patrons of the system, 50 per cent of the total passengers carried, a small park located on one of the car lines was given nominal financial encouragement and advertised on the cars. Five months operation of this park increased the gross revenue through additional patronage to such an extent that 250 per cent was realized on the investment.

In another attempt to bolster up car riding the inconspicuous standard car color was changed to a bright orange. The first car that came through the paint shop in its changed garb bore slogans to advertise street car riding as the most economical and safe transportation medium. It was run for three days in regular service on each of the city lines. During the first three days operating receipts were 6 per cent higher than those of the other cars on the same line. A favorable editorial carried in one of the local papers regarding this innovation proved the experiment a decided success.



Six street car routes serve the city of Charleston, S. C.

Several minor changes of practice and organization have reduced operating costs a surprising amount. Energy conservation was obtained through further instruction of trainmen in the use of power and handling air brakes. The men's interest was aroused and co-operation obtained by comparative graphic records. As a check on energy consumption enough recording watt-hour meters were provided to equip one car of each type operated and these cars were so rotated in service as to obtain a measure of the same results as if all cars were equipped with meters, with 87½ per cent less cost. The saving effected was over 10 per cent, measured in kilowatt-hours per car-mile.

A more efficient system of fare collection and registration resulted in a smaller loss of gross revenue. The year before the system was installed gross revenue decreased 18 per cent. During the next year nine months' gross decreased 9 per cent and the first full year it was in operation the decrease was 5 per cent. Incidentally, the proportion of total revenue increased 10 per cent.

A "Daily estimate, income from operations" sheet, showing relation of actual revenue to operating expense, based on a closely estimated car-hour cost, served as a check on the profit of the service. Together with frequent traffic checks it made possible the proper co-ordination of schedules with traffic requirements, reducing car-hour wastage to a minimum while fulfilling the demands of the riding public.

Reduction of forms in size and number and combination of some of them has saved money without sacrificing the detailed information required. The purchase of a mimeograph machine aided this work.

The storeroom account had shown little reduction since the war period. A close check of quantities required cut this account 20 per cent, with consequent saving in money tied up in stock and interest thereon.

Careful reorganization of the supervisory force resulted in a 50 per cent reduction of this body, with improved efficiency. Understudies were provided for all positions in preparation for emergencies such as vacations, vacancies, illness, etc.

When shop employees were paid off during working hours, practically every man came back to the receiver's office for change. The loss of time was obvious, so the system was changed. Today the men are paid off at quitting time and a saving of 2 per cent per year has been gained.

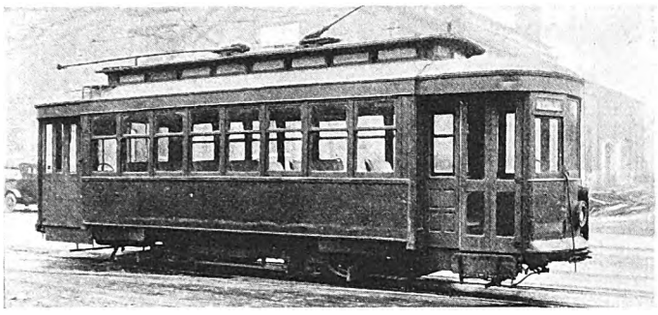
Comparison with other systems, as well as an improved account classification, directed attention to possible economies in shop organization. In 1923 the force consisted of more than 60 men. In 1924 it was reduced 39 per cent; in 1925, 8 per cent; and in 1926, 10 per cent, a total over the period of 57 per cent. In 1923 the railway employed one shop man for every 22,000 passenger car-miles operated; now there is one employee for every 47,000 passenger car-miles operated.

Maintenance Costs Cut to Half

Increased efficiency and modernization of shop practices, introduction of forms necessary to provide information placing definite responsibility for car failures and abnormal costs, together with the co-operation of the shed force obtained the result that car mileage per pull-in was increased from 1,200 in 1923 to 6,500 in 1926—more than 400 per cent. During the same period, the maintenance cost per car-mile was decreased from 4.95 cents in 1923 to 2.65 cents in 1926, practically 50 per cent reduction. Some of the practices that were a means to this end are given in brief form.

The adoption of the spray method reduced the labor cost of painting cars 40 per cent. It made possible the completion of necessary work in three-quarters of the

Digitized by Google



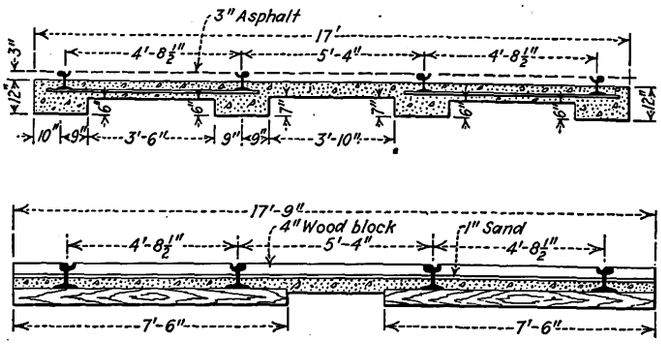
The old single-truck cars weighed 14 tons, consumed 2.02 kw.-hr. per car-mile and had a maintenance cost of 3.15 cents per car-mile

time formerly required, and the painting force was used to advantage on outside work during the time saved, with consequent credit to maintenance of cars.

Waxing cars, instead of washing, has made possible the use of a much cheaper system of painting, and the paint lasts half again as long as resulted from the former more expensive system. It has effected a 25 per cent saving in labor.

Dipping and baking of armatures and fields has increased mileage of armatures from 150,000 to 308,000, more than 100 per cent, and that of fields proportionately. For one type of motor in regular operation, thirteen armatures had to be rewound in 1925. In 1926 this was reduced to two. The dipping and baking outfit was assembled and constructed from scrap material at a cost of less than $30.

Life of armature bearings was far below the average. Purchase of a pyrometer for $50 insured pouring of bearing metal at the proper temperature. The bearings were pressed on under sufficient pressure and care was



Old and new construction for double track. Wood ties are replaced by No. 3 standard steel ties, and asphalt is substituted for wood block

taken to see that the bearings were kept free from dirt and grit. These methods have increased the life of armature bearings 65 per cent.

The actual expenditure for a circuit breaker testing set was $4. It has been helpful in the reduction of maintenance of electrical equipment of cars. Polarity tests for motors have had a similar result, with a saving of time in assembling motors. Radio testing for defects in electrical equipment proved practical, low armatures even being discovered by its use.

The cast-iron wheels used were found to have a sufficiently thick chill to warrant a trial of wheel-truing brakeshoes. The trial was successful and the continuance of this practice increased car wheel life from 18,000 to 60,000 miles, or 300 per cent. Standardization of brake heads made possible the use of a number of brakeshoes that had been classed as obsolete along with the cars for which they were originally purchased. Improved brake rigging, costing $30 for each car, avoided the necessity for the purchase of slack adjusters and reduced "pull-ins" and maintenance costs.

Lubrication costs were reduced 13 per cent through continuous checks and employee instruction in economical methods, and trolley wheel mileage was increased from 4,500 to 8,000 miles through improved lubrication. By using both ends of brushes, the cost per mile of carbon brushes was reduced from 0.034 cent to 0.015 cent.

Statistics on Interstate Electric Railways

OF THE electric railway companies of the country 252 do an interstate business and report operating statistics to the Interstate Commerce Commission. Some of these, like the United Electric Railways of Providence, R. I., are primarily city systems but have interurban extensions. Others, like the Kansas City Public Service Company, report because some of its city lines cross the border line of two adjoining states. But most are primarily interurban lines. Some of the statistics, contained in a report of the Interstate Commerce Commission, Bureau of Statistics, for the year ended Dec. 31, 1926, are given in the accompanying tables.

FINANCIAL AND OPERATING DATA FOR CALENDAR YEAR 1926 OF INTERSTATE ELECTRIC RAILWAYS

Item	Total, All Districts	Eastern District	Southern District	Western District
Number of companies reporting	252	167	8	77
Miles of road operated	13,221	7,613	453	5,155
Freight revenue	$39,382,332	$15,531,408	$2,629,703	$21,221,221
Passenger revenue	138,428,701	78,771,689	2,196,964	57,460,048
Total operating revenues	$191,949,159	$102,350,282	$5,197,002	$84,401,875
Total operating expenses	160,702,288	85,228,330	3,931,971	71,541,987
Taxes assignable to railway operations:				
Other than U. S. government taxes	$11,300,002	$6,128,924	$445,081	$4,725,997
U. S. government taxes	997,495	659,496	110,787	227,212
Operating income	36,137,540	24,547,000	1,337,964	10,252,576
Net income	12,216,134	6,512,243	22,224	5,681,667

Ranked in the order of gross operating revenue, the Pacific Electric Railway of Los Angeles, Cal., is by far the largest company reporting, its total operating revenues for the year amounting to $19,111,164. The Hudson & Manhattan Railroad comes next with $8,855,678. The United Electric Railways of Providence, R. I., comes third with $8,193,660. The Chicago, North Shore & Milwaukee comes fourth with $7,730,152. The Kansas City Public Service Company comes fifth with $7,664,599.

SUMMARY OF SELECTED FINANCIAL AND OPERATING DATA FOR CALENDAR YEAR 1926

Item	Total, All Districts	Eastern District	Southern District	Western District
Rolling stock:				
Buses	998	568	1	429
Passenger-carrying cars	11,843	6,957	272	4,614
Freight cars	16,483	6,024	341	10,118
Other cars	3,279	1,971	76	1,232

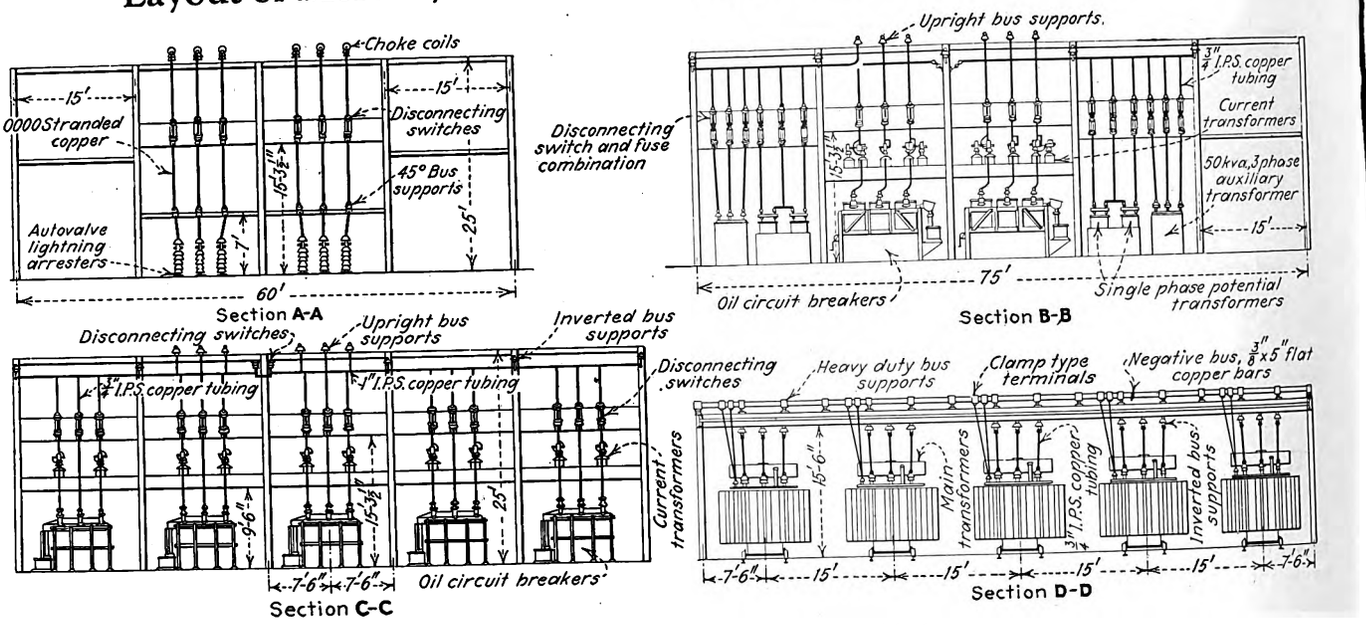
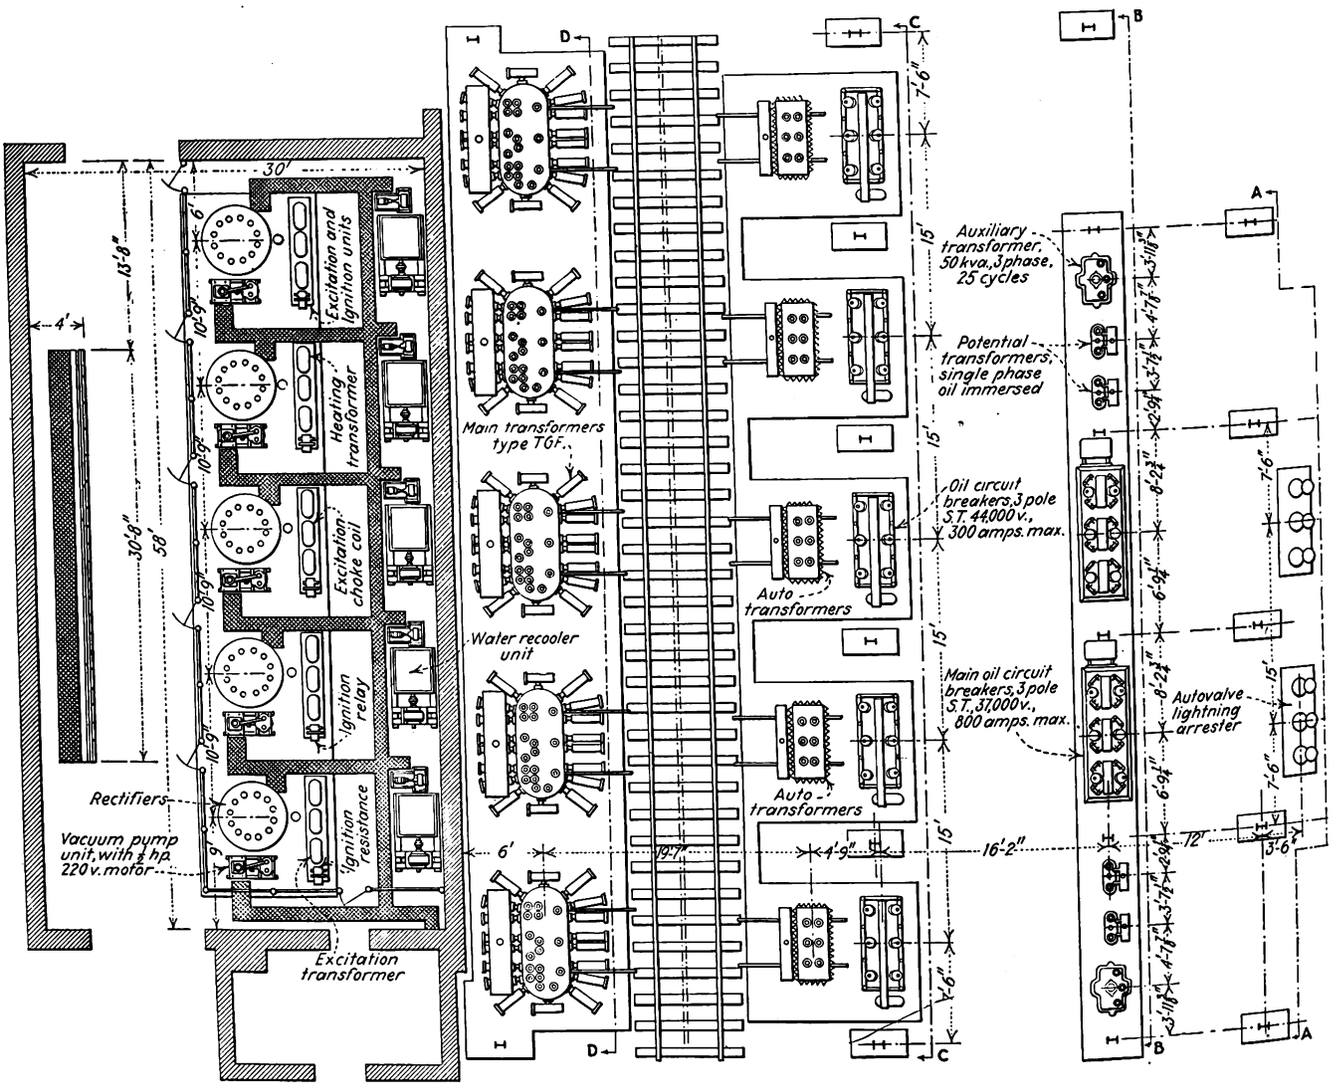
Layout of Mercury-Arc Rectifier Station at Bridgeport, Conn.

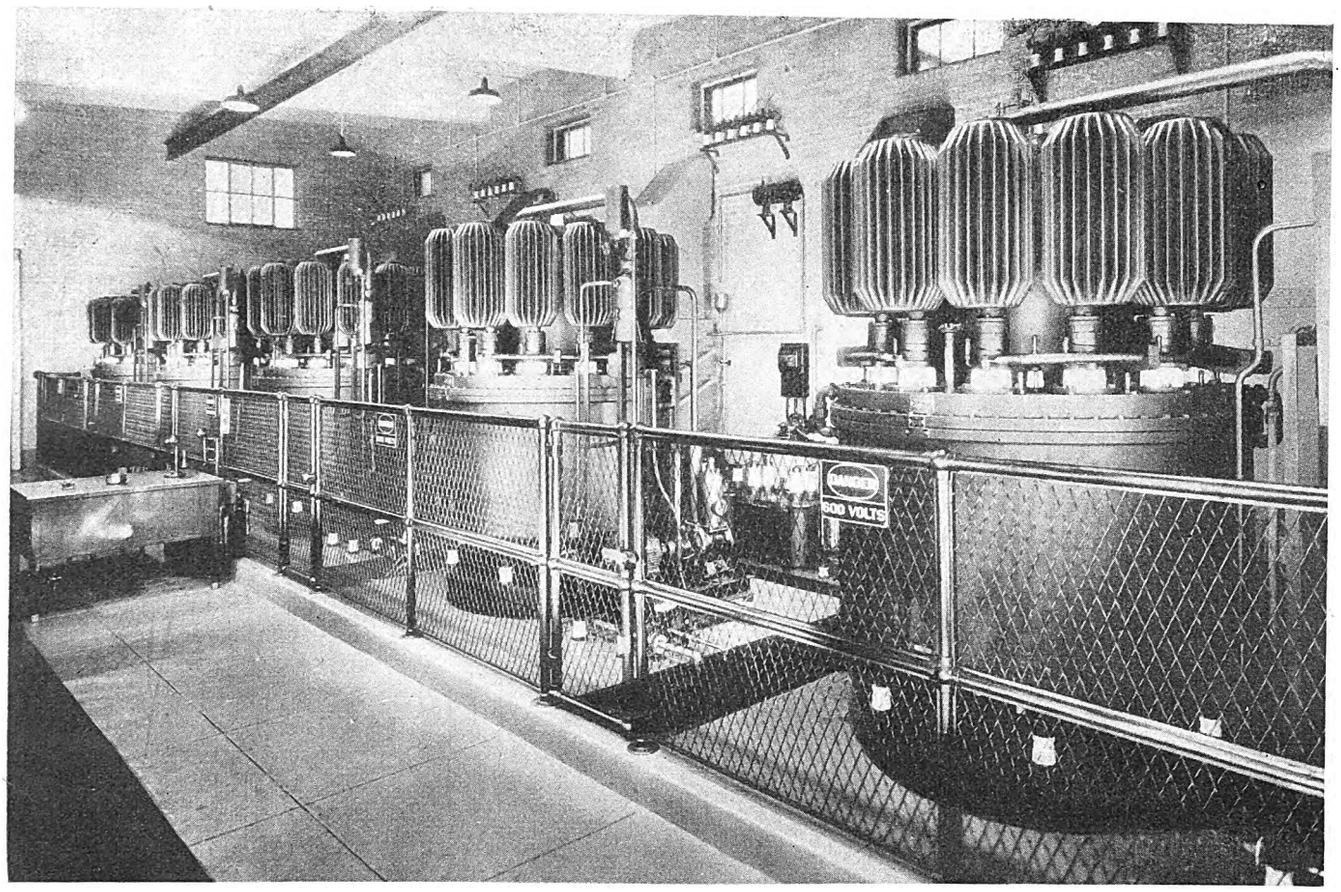


Cross-sections at A-A, B-B, C-C, and D-D of ground plan



Ground plan of new substation

Digitized by Google



This battery of five 2,000-amp., 600-volt mercury-arc rectifiers is said to be the largest installation of its kind in the world

Largest Mercury-Arc Rectifier Installation Made at Bridgeport

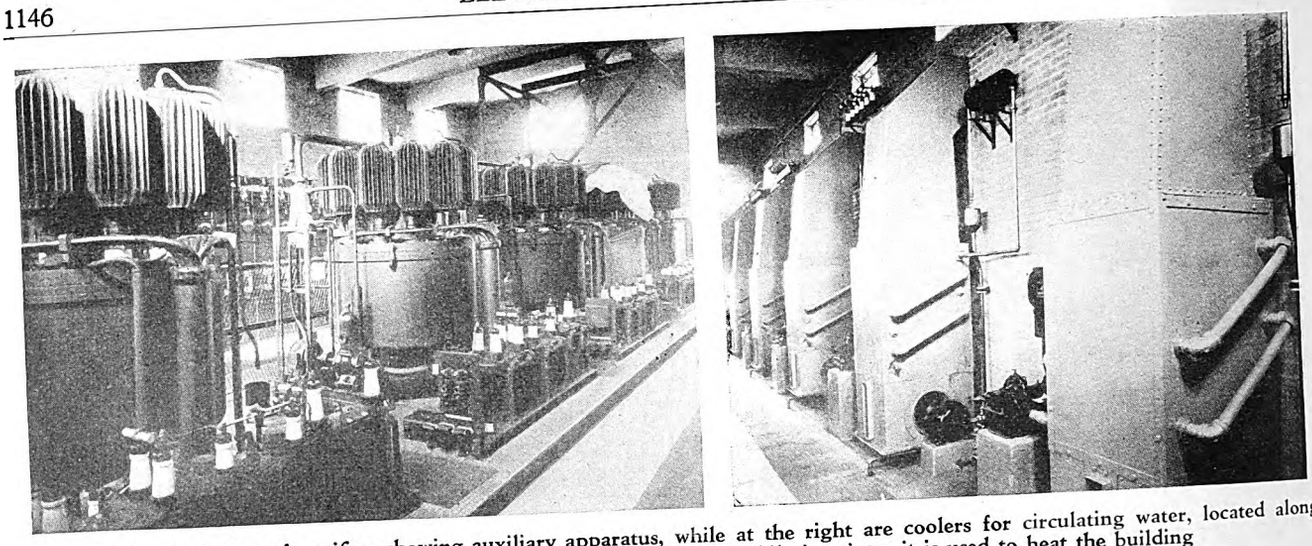
Connecticut Company has replaced old generating station by two new substations. Energy is now purchased. Operating cost has been reduced more than 25 per cent

WHAT is said to be the largest installation of mercury-arc rectifiers in the world has been made by the Connecticut Company at Bridgeport. Two new substations have been designed and built under the supervision of George E. Wood, power engineer, one in the center of the city having five 2,000-amp., 600-volt units and a second in the nearby town of Stratford having two units of the same size. These are among the first substations where the entire load is carried on rectifiers. The pre-eminence in capacity of the Bridgeport substation may be of short duration, however, as an order has already been placed by the Commonwealth Edison Company of Chicago for two 5,000-amp., 600-volt rectifiers and it is possible that the size of this installation may be increased in the near future.

The designs of the new substations are the result of studies commenced early in the fall of 1926 by the Connecticut Company looking to the creation of modern power facilities for its electric railway lines in that district. The company's Seaview Avenue generating station was antiquated and costly to operate. Its location was remote from the load center and considerable loss was occurring in the trunk feeders. Another influential factor was the impending necessity for the company to spend about $60,000 for a new submarine cable crossing at the Yellow Mill River, where the city was planning to relocate an important highway bridge.

Studies made by the company's engineers indicated that the power demands could be met most satisfactorily by the construction of two substations, one in the vicinity

Digitized by Google



At the left is a back view of rectifiers showing auxiliary apparatus, while at the right are coolers for circulating water, located along back wall. In summer the warm air is released outdoors, while in winter it is used to heat the building

of the Congress Street carhouse in Bridgeport and the other at Stratford. The former, which is manually operated, is designed to carry the bulk of the load, while the latter, which is fully automatic, serves the eastern part of the territory.

Mercury-arc rectifiers were chosen for four reasons: (1) Efficiency; (2) ability to operate on either 25 or 60 cycles; (3) low maintenance cost; (4) freedom from heavy foundation requirements.

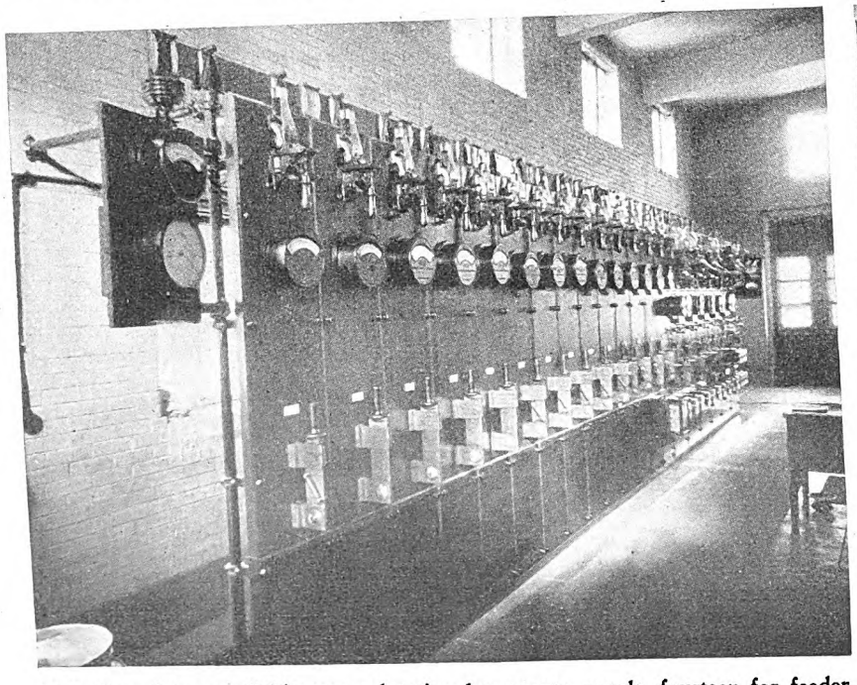
For convenience and simplicity it was decided that all units at both substations should be the same size. Accordingly, seven 2,000-amp., 600-volt rectifiers were ordered from the American Brown Boveri Electric Corporation early in the present year. Each unit has a momentary overload capacity of 3,000 amp.

Energy is at present obtained from the generating station of the Connecticut Light & Power Company at Devon, on the Housatonic River, 7 miles east of Bridgeport. It was considered possible that at some future time the Connecticut Company might wish to purchase its energy from the New York, New Haven & Hartford Railroad, which operates on 25 cycles. Thus, the ability of the mercury-arc rectifier to operate at either 25 to 60 cycles is an important advantage it has over the rotary converter for this installation.

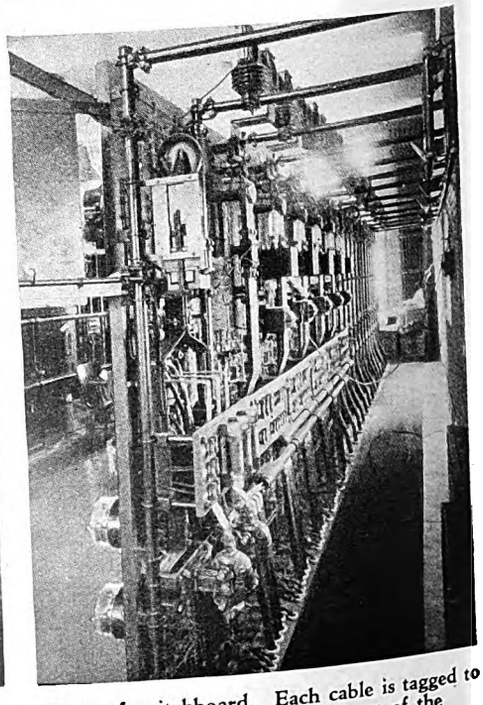
Another important advantage in this instance is that the rectifier does not need foundations as heavy as for a rotary. The new Bridegport substation is on made land between the Congress Street carhouse and the Pequonnock River, and foundations sufficiently heavy for rotary converters would have involved considerable cost.

From the Devon generating plant of the Connecticut Power Company two 13,000-volt, three-phase, 60-cycle transmission lines have been built to the new substations. Both of these are located close to the right-of-way of the New York, New Haven & Hartford Railroad and the transmission lines are carried on the existing overhead bridges of the railroad.

Outdoor equipment at the Bridgeport substation includes auto-transformers, main 1,400-kva. transformers,

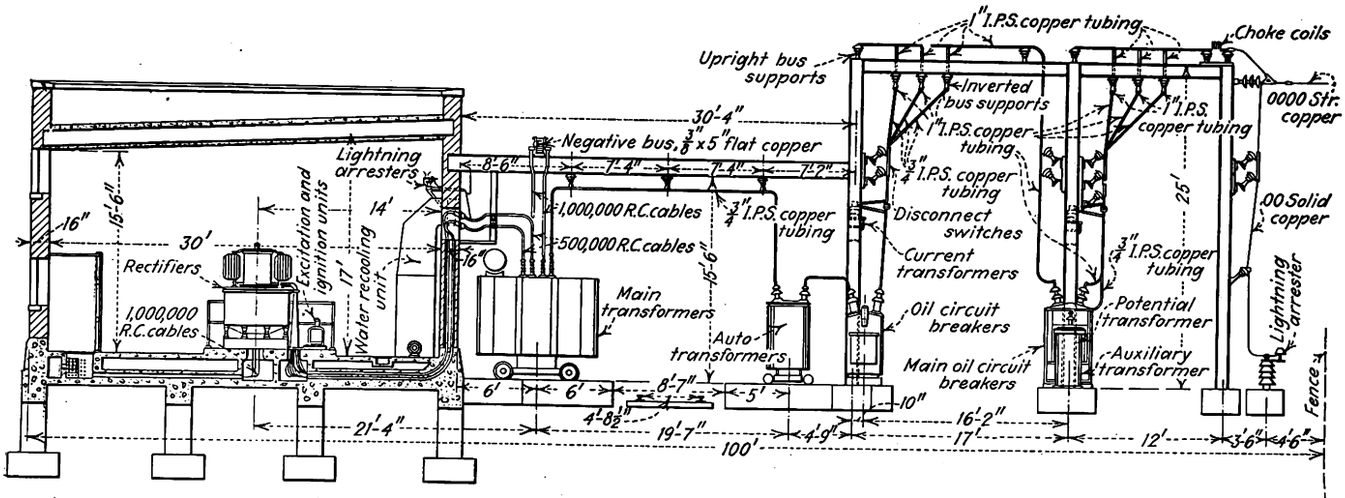


Switchboard in new Bridgeport substation has twenty panels, fourteen for feeder lines, five for rectifier control and one for incoming lines and transformers, switches, etc.



Rear of switchboard. Each cable is tagged to prevent confusion on account of the complicated wiring

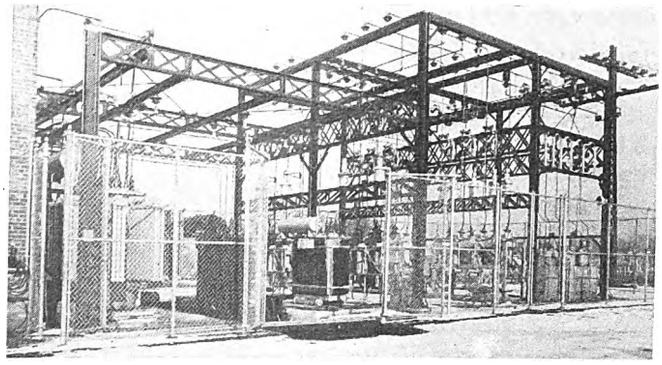
Digitized by Google



Side elevation, showing arrangement of apparatus in new Bridgeport substation and outdoor transformers and auxiliary control

as well as the usual disconnecting switches, oil circuit breakers and other auxiliaries. The auto-transformers are provided with five taps 2 per cent above normal rating and five taps 2 per cent below normal. The reason for the use of these units is to permit operation at 6,600 volts, 11,000 volts or 13,900 volts as desired. It was felt by the designing engineers that it would not have been feasible to design the main transformers to operate satisfactorily at these various voltages.

Inside the substation are the five rectifiers with their circulation pumps and the switchboard. This board has twenty panels. At one end is a panel for the incoming lines and auxiliary control. On this are mounted also the main and auxiliary meters. Next are five rectifier panels, on which are mounted a.c. remote control switches, d.c. circuit breakers, overload, reverse power and thermal relays, as well as switches for the rectifier auxiliaries, d.c. ammeters and vacuum indicators. At the other end are fourteen feeder panels with circuit breakers, switches and ammeters.



Outdoor equipment at Stratford automatic substation, which is similar in design to the new Bridgeport substation

All auxiliary switches are normally closed. The procedure to put a rectifier in service is to close the a.c. circuit breaker, then the d.c. circuit breaker, check the voltage and close the main rectifier switch.

Work on the building at Bridgeport began March 27. The first unit was put in operation Aug. 15 and all were in operation by Sept. 26. No trouble of a serious nature has been experienced since these rectifiers have been in service. The longest interruption has been one minute, and in every instance where a rectifier has gone out of service the same unit has immediately been put back. There has been no radio interference and only slight telephone interference, which has now been eliminated.

An over-all efficiency of 93 per cent, including line losses, has been obtained since the rectifiers have been in operation.

The broad window with visor above gives an attractive effect to the front end

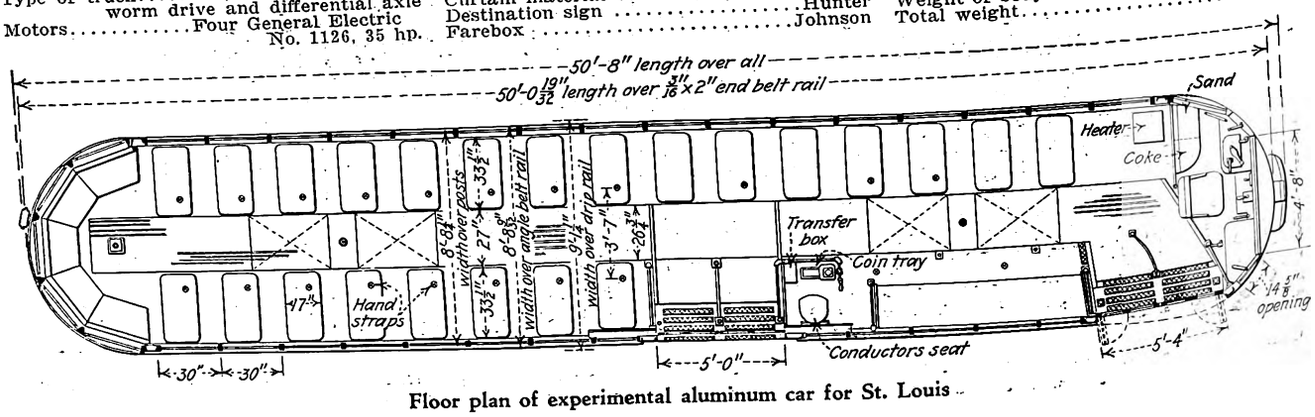
Aluminum Car Tested in St. Louis

Large front-entrance, center-exit, single-end car, designed for light weight and quiet operation in congested city service, is mounted on worm-drive trucks

SPEEDY, easy riding and attractive, the new car just placed in service by the United Railways of St. Louis should win customers and please the public. With a few exceptions the entire underframing is constructed of duralumin. This material has also been used in the construction of some of the equipment parts. The general appearance of the body is much the same as that of the cars now operated by the company. It is a single-end car and has front entrance and side exit. Streamline painting has been used to give a pleasing effect. The color scheme consists of a cream color above the arm rail, with orange below. The interior is natural

DIMENSIONS AND EQUIPMENT USED IN EXPERIMENTAL ALUMINUM CAR

Length over all	50 ft. 8 in.
Width over all	9 ft. 1¼ in.
Height over trolley board	10 ft. 11 in.
Side post centers	30 in.
Side glass	26 in. x 26 in.
Front-end glass	28 in. x 54 in.
Truck centers	24 ft. 6 in.
Truck wheelbase	5 ft. 6 in.
Journal centers	5 ft. 9½ in.
Diameter of axles	4½ in.
Diameter of wheels	26 in.
Worm-drive ratio	7⅔ to 1
Gage	4 ft. 10 in.
Type of truck	Timken Detroit with worm drive and differential axle
Motors	Four General Electric No. 1126, 35 hp.
Air brakes	Westinghouse automotive type with DH-16 compressor
Control	K-75-A
Line switch	General Electric No. 986
Seats	Hale & Kilburn No. 208 de luxe
Door operating mechanism,	National Pneumatic, safety interlocking
Interior trim	Cherry
Headlining	Agasote
Sash and sash fixtures,	O. M. Edwards Company
Car signal system	Faraday
Curtain fixtures,	Curtain Supply Company, Ring 88
Curtain material	Wyndasote
Destination sign	Hunter
Farebox	Johnson
Heater	Peter Smith hot air
Headlight	Ohio Brass
Step treads	Feralun (aluminum)
Sander	Nichols-Lintern
Register	Security
Handbrake	Automotive
Trolley catcher	Ohio Brass
Trolley base	U. S. No. 20
Seating capacity	60
Weight of truck including wheels and axles	4,302 lb.
Weight of gears, housings and brakes	1,240 lb.
Weight of G. E. No. 1126 motor	479 lb.
Weight of truck complete	6,500 lb.
Weight of body complete	19,554 lb.
Total weight	32,054 lb.



Floor plan of experimental aluminum car for St. Louis

Digitized by Google

cherry with cream ceiling. All woodwork above the windows is stippled to harmonize with the light ceiling and cherry trim.

Cross seats are used except for a single longitudinal seat at the front right-hand side, which provides for five passengers. With a semi-circular seat at the rear, the total seating capacity is 60. The cross seats are non-reversible. They have a cane covering trimmed with Spanish brown leather. Deep springs are used in the cushions and backs.

A cabinet houses the front-end control and air-brake equipment. A large front-end plate-glass window measuring 28 in. x 54 in. gives free vision to the operator. There is a metal visor, above which are roller signs to give the route number and destination.

Twenty-five 36-watt inside frosted lamps provide the illumination, and these, together with the light colored ceiling, give a very brilliant effect.

The car is arranged for either one-man or two-man operation. For use when operated as a one-man car there is a backing-up control equipment which is installed in an aluminum stanchion placed in the center at the rear of the car. A foot gong is also provided in the base of the stanchion. This arrangement of the control equipment makes it possible for the motorman to back the car without disturbing passengers.

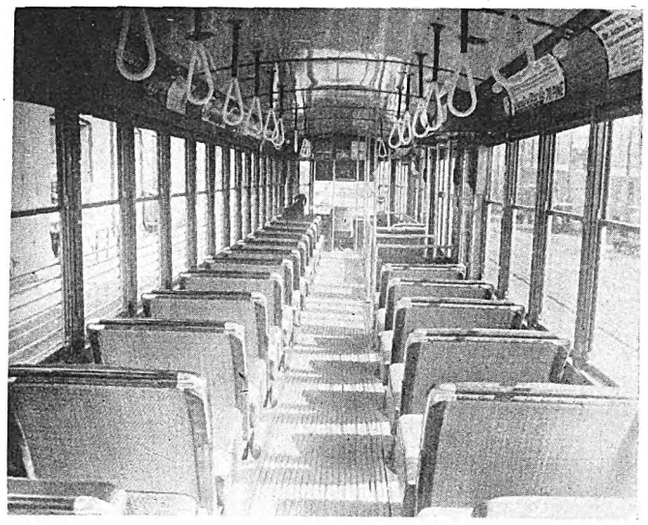
The General Electric No. 1126, 600-volt motors have been designed especially for this purpose. They are considerably lighter and of smaller dimensions than the standard railway motor of the same horsepower. The four motors, rated at 35 hp. each, are spring suspended and connected to the axles by flexible propeller shafts and worm drive. Each motor is suspended longitudinally from the truck frame in such a manner that the mass consisting of the motor and part of the drive is spring supported. The driving connection between the motor and worm is made by means of a short shaft fitted with flexible couplings at its ends.

The axles are Timken Detroit, and the gear ratio is 7⅔ to 1. To reduce the transmission of noise rubber has been used in many places, such as at the center plate and side bearings. The wheels are also of experimental design intended to reduce operating noise to a minimum. Copper jumpers provide a path for the electric current.

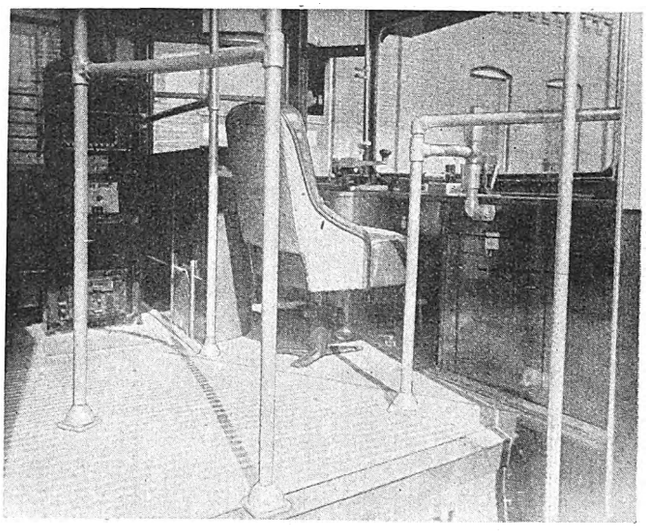
Brakes are of the internal expanding drum type having metal brakeshoes. They are applied by Westinghouse air diaphragms, an individual diaphragm being used for each brake. The brake drum is located approximately at the center of the axle, thereby equalizing the torque set up in the axle at each brake application. This particular design is used as a means to reduce noise and provide a more uniform braking of cars than is possible with the conventional brakeshoe on the wheel.

Comparison of the weights of the worm-drive truck with standard trucks operated by the company and equipped with the regular GE-265 traction motors shows that the worm-drive truck complete with two motors weighs about 1,000 lb. less, or 2,000 lb. per car.

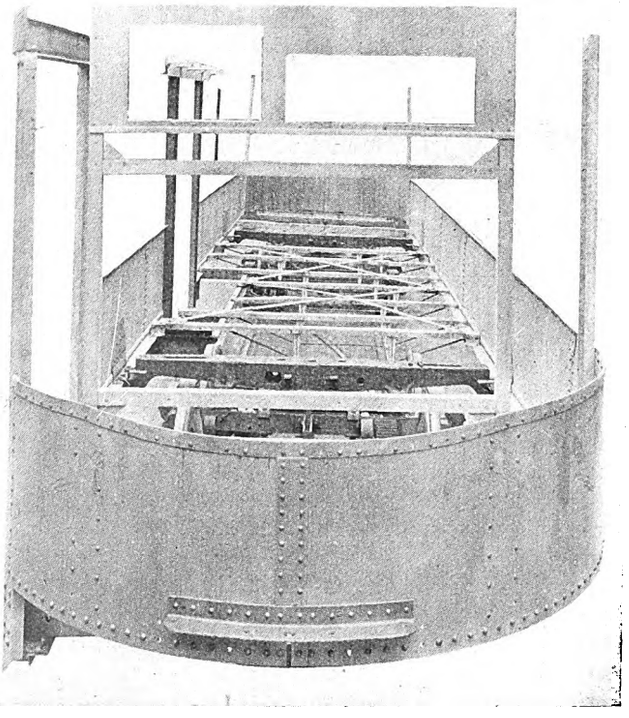
Particular attention has been given to keeping the weight low, so that this car weighs but 32,000 lb. as compared with 40,000 for other new types of cars operated by the company. While the cost of the car is somewhat greater than for previous types, it is expected that the saving in energy consumption will offset this increased cost. The first trial run was made on Oct. 25. Following this preliminary test of performance the car was exhibited in the main thoroughfares of the downtown district of St. Louis.



Seat cushions and backs are cane covered with deep springs. A trimming of Spanish brown leather gives a pleasing effect



The control and air-brake equipment is housed in cabinets at the front end of the car



The underframing was constructed almost entirely of duralumin

Route numbering and lettering are features of European electric railway and bus practice

1. This view was taken in front of the Bourse, or Stock Exchange, in Brussels, Belgium. This and the other views on this page show clearly the character of island platforms used extensively in Europe. They not only add to the safety of boarding and alighting, but shorten the length of car stops.

2. Two-car train on Kürfursterdamm in Berlin, showing island platform.

3. This practice of displaying schematic maps of car routes is very common in Europe and is of great assistance to strangers in getting about. This map is mounted on an island platform of the Dortmund Street Railway, Germany.

4 and 5. These views were taken in Naples and illustrate clearly some of the points already mentioned, namely, the street car marking by route numbers and lettering, and the island platforms. The square post in view No. 4 carries information about the car routes.

The London Underground management takes no chances that passengers will get on a wrong train. This station indicator at St. James Park station on the Metropolitan District Railway indicates by illuminated numbers the destinations of the next three trains which will stop at this station

Answering Questions Before They Are Asked

European electric railway and bus companies have developed a very effective method of signing their stopping points as well as their cars and buses

By Henry W. Blake
Senior Editor *Electric Railway Journal*

QUESTIONS about the service that are most frequently asked by a person wishing to travel by an electric railway to some destination are: Where can I get a car? How often do they run? How near does it go to the point I want to reach? How long does it take? How shall I know when I get there?

If the person is a regular patron of the line he knows the answers to these questions. If he does not travel regularly on the line and cannot get satisfactory answers to these inquiries, he will often ride in a taxi when a car or bus would have taken him to his destination just as quickly and more cheaply.

One of the principal features of European electric railway and bus practice to impress the visitor from America is the excellent ways in which these questions of intending and actual passengers are answered before they are asked. This may be due, in part, to the larger number of tourists in European cities and the consequently greater need to cater to this class of traffic. Be that as it may, it is very easy for a person in a European city to find the car or bus which will take him to any desired point, and where he can board it. After he does so he can learn from notices and maps on the car or bus when he is approaching his destination.

The principle upon which this method is based is the identification of all routes by numbers or letters which are carried in a conspicuous position on the car or bus. The same numbers also appear in maps distributed by the company of its different routes, on the stop signs to show which routes pass those points, on the backs of transfer tickets where routes have to be designated, and in other ways. The position of this number on the car and bus is usually on the hood, with often a list of the principal points passed on the route. The number and list are often repeated on the sign carried on each side of the roof.

In London the law requires all buses to carry such a list on both their front and rear ends, and the list must read downward in the direction in which the bus is going.

Route maps carried in Paris cars

The information given to the passenger does not stop after he boards his car. He is told the direction in which he is going, the stop at which he must get out to reach his destination, and other helpful information. The upper engraving shows the simple schematic diagram carried on the surface cars in Paris; a similar map is carried on the bus lines. This map gives in addition to the route number, principal streets crossed, fare zones, average time of trip between different points, all connecting bus and trolley lines, etc. The chart below is a sample of one carried on the Paris rapid transit cars. While it necessarily differs somewhat from that carried on the surface lines, as there are no fare sections and a flat rate is charged, it is equally replete with information, showing even the nearest house number on the streets adjoining the subway stations.

In Paris, where both buses and cars are operated by the same company, the car routes are distinguished by numbers and the bus routes by letters, but as there are more bus routes than letters in the alphabet many of the routes have to be distinguished by two letters, like AB, AC, BD, etc.

The method described of route designation by carefully worked-out signs for cars is followed not only by the city railways, bus lines and rapid transit systems but by the steam roads in Europe as well. While the latter do not use route numbers they generously placard their cars with route and destination signs.

Publish Maps and Time-tables Also

The next part of the problem of merchandising transportation by route signs and numbers is to familiarize the public with these numbers and the routes to which they apply. This is done in Europe in several ways. One is to post maps and time-tables of the routes with the numbers marked on them at different places, particularly at the stopping points. Another is to distribute pocket maps of the city with the routes marked on them, accompanied sometimes by supplementary merchandising information, such as a list of interesting places to visit. Sometimes these maps are given away, as by the London Underground, London General Omnibus Company and London County Council Tramways. More often a small charge is made, as 2½ cents in Berlin. In Brussels, Paris and Rome somewhat more pretentious pamphlets are issued, giving besides a map much information about the lines. These pamphlets are sold at a very low price.

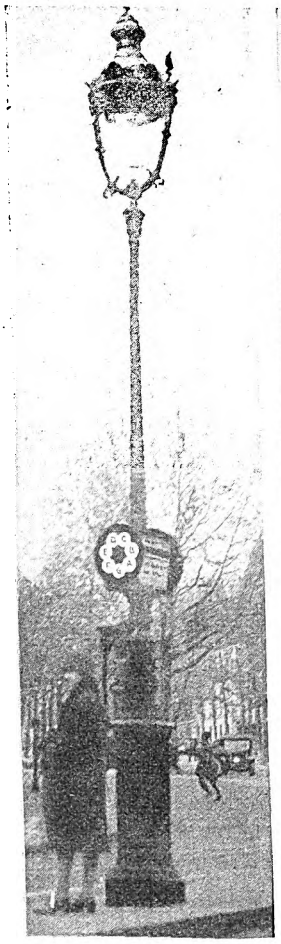
The London County Council supplements a plan of issuing maps and time-tables by having at two or three important traffic points a large map known as a "path-finder." On each side of the map are 20 or 30 buttons, each marked with the name of a place which a person might want to reach. When a button so marked is pressed, a row of lamps behind the map illuminates the route to that point. Particulars of this map were published in the issue of the Journal for Sept. 3, 1927, page 395.

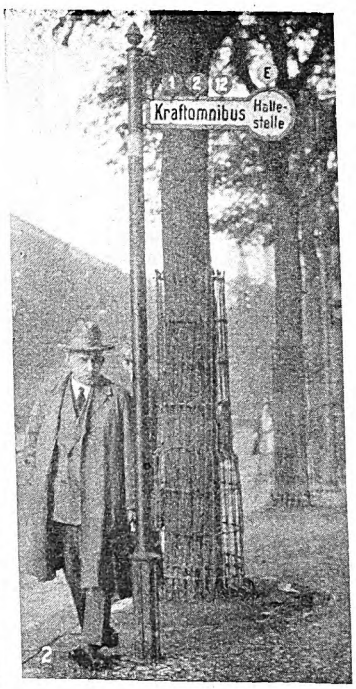
Stopping Points Marked

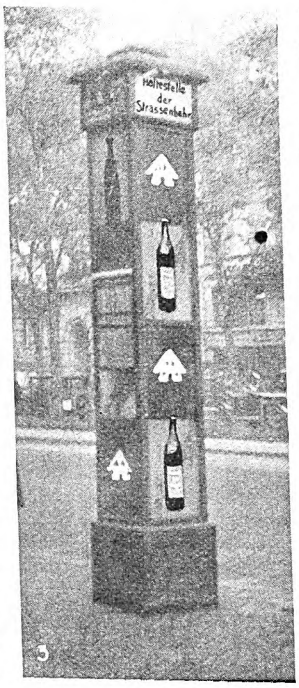
After learning what car he needs to take to go to his destination and the streets on which it runs, the next need of the prospective passenger is to know where he can board the proper car or bus. The points at which cars and buses stop to receive and discharge passengers are farther apart than is usual in the United States. The average distance in Paris is 250 m., or about 6½ to the mile, but an average of 79 continental city companies, quoted in a recent European convention paper, is 375 m., or 1,230 ft., nearly four to the mile.

In every European city these stopping points are very

Digitized by Google





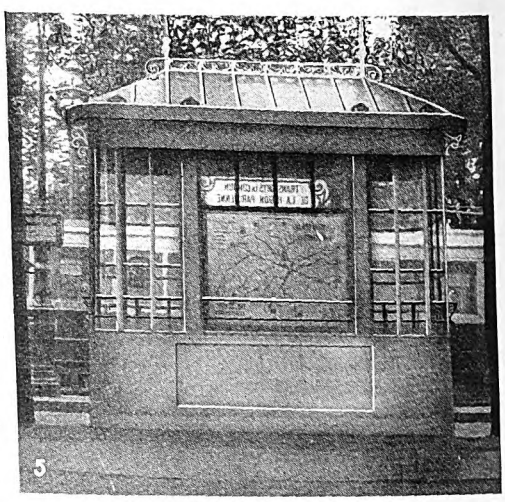


Stop signs and stations in different cities in Europe

1. Stop sign on waiting platform in Paris. The stop sign is cylindrical in form with the letters of the routes passing that point conspicuously displayed.

2 and 3. Bus and street car stop signs in Berlin. Both give the numbers of the lines passing that point. The street railway stop sign takes the form of a square post, on which advertising is displayed besides the information about the car lines passing that point. The sides are translucent, so that the lamps inside make the wording easily legible at night. The advertising on the post illustrated in 3 helps defray the cost of their construction.

4. Stop signs in Naples, showing optional stops for eleven car lines.



5. Sometimes an attractive waiting station is erected at the stopping point, as at this location on the Avenue de Friedland, Paris. A skeleton map of the system is displayed in a frame, so that passengers can easily select their routes.

6. A simple waiting station and stop sign on the Avenue de la Toison d'Or, Brussels, quite near the office of the Brussels Tramway Company.

7. Waiting station on the Victoria Embankment near Westminster Bridge, London, for passengers waiting to take the cars of the London County Council Tramways.

8. Waiting station at Place Massena, Nice. Through cars are run from this station to many surrounding points, including Monte Carlo.

Rapid Transit stations in Paris are well signed

It is practically impossible for any person to go astray in the stations of the Paris subway system. The upper views show ticket booths in two typical Paris stations. The lower view shows a train platform. In the passageway and on the station platform signs give the direction of the trains stopping at that platform, the stations which can be reached by these trains and other data helpful to passengers.

clearly marked. Occasionally the marking is simply a metal sign, hung on the span wire in the case of a trolley line, or attached to the side of a house for a bus line. More often it is of ample dimensions, say 15x24 in., carried on an ornamental post set in the sidewalk or on an island platform. Stopping signs of this kind, as used in Paris, Naples and London and by the Berlin buses, are illustrated.

Such signs usually carry a list of the car and bus routes stopping at that point. In Italy and England these route numbers are painted on the board attached to the post supporting the stop sign. In Paris the route numbers are listed on each side of a cylindrical casing containing a lamp so that it can be read at night. The Paris view published is of a stopping point for both electric cars and buses, as shown by the fact that it carries numbers (electric car routes) and letters (bus routes). In Germany the most common form of electric railway stop sign is a built-up post with iron frame and glass sides, about 2 ft. square and 8 to 10 ft. high. The space on this post at about 5 ft. from the ground is given up to time-table and other information about the railway lines passing that point. The rest of the space on the post carries commercial advertising. This post, like the Paris signs, is illuminated at night.

Another feature of European stop points is the large number of raised platforms used. In fact, this type of loading platform is much more common in Europe than in the United States, possibly because heavy snow storms are not frequent in winter in Italy, France, Belgium, Holland and in a good part of Germany. Many of the systems also have waiting shelters at important boarding or transfer points. Views are given of typical stations of this kind in Paris, Brussels and Nice.

Information on the Car Also

European transportation companies do not think their duty of supplying information to the passenger ends when he is safely on the car or bus. He still wants to know where to get out. The Paris companies seem to give the most complete information on this point. Every car and every bus carries a schematic map of its route. That of electric railway route No. 105, or from Vitry to Place de la Concorde, is reproduced. It shows not only the car route very plainly, but also all points of interest passed, like railroad stations, all cross streets, and also, at the bottom, all points of transfer to bus and other street railway routes. The bus routes are indicated on the map by letters such as "AC," "AL," "AF," etc., and the car routes by the numbers.

At the top of the map information is given of the length of time taken in minutes between different points, and the limits of the different fare sections. In addition to this map each car also carries a small poster with somewhat duplicate information, though without a map, such as the streets crossed, those at which stops are made,

This supplementary chart carried in the Paris surface cars gives all stops, fare section limits, fares and other information

Digitized by Google

and the rates of fare for the several sections. It is of enameled metal.

Similar maps are carried in the Paris buses. In London full information about the route and rates of fare is given in posters carried inside the buses and cars, but maps are usually not included.

Station Indicators of Rapid Transit Lines

The rapid transit lines are as thorough in signing their stations and cars as are the surface lines. Indeed, the information given is even more elaborate than on the surface lines because an alighting passenger is less able to identify the point where he may happen to be by his surroundings.

In Paris, every station has its name prominently displayed in several places and also the direction of the trains passing each platform. The direction is indicated by naming the terminal station. Many stations are transfer points, and where this is the case and the passenger walks from one station to another, the passageways are very clearly marked. A recent improvement has been the introduction in a number of the passageways leading to a station of an automatic gate which closes when a train is about to enter a station. In this way the danger of passengers arriving late and attempting to board the car while in motion is prevented. The operating mechanism of this gate is an electric motor with worm gear and pinion. Passengers are warned by a sign not to attempt to pass through to the station platform while the gate is closing. After the train has left the platform the gate opens automatically.

Paris has only one route on which there are any branch terminals. Hence, there is little need for changeable platform route indicators. However, these have been developed to a marked degree on the London Underground lines. The latest form is the indicator at St. James Park Station, illustrated on page 1151. Here fifteen routes are indicated on the indicator board and illuminated numbers show in advance of the arrival of each train the destinations of the next three trains. With such definite information before him it is hardly possible for any underground railway passenger to go astray.

Rapid Transit Cars Also Carry Maps

All rapid transit cars in both Paris and London also carry maps. One of those used in Paris is reproduced, as it is somewhat different from the form of map used on the Paris surface cars and buses.

Two of these maps are carried in a frame in the center of the car back to back so that they can be seen by passengers in all parts of the car. The route shown is No. 7, in the form of a "Y." The heavy line shows the route, the cross lines, printed red on the map, show connections. The lettering in the panels at each station gives the names of the streets close to that station, with the nearest house numbers. On the outside of the train, the direction is shown not only by light markers but by lettered signs on the front and rear ends of the train, by lettered signs on each car, so placed that they can be read from the platform and by color markers inside the car similar in color to those on the ends of the car. All of this is in addition to elaborate lettering and illuminated signs on the platform.

On the London rapid transit lines much the same system of illuminated maps with supplementary printed lists of stops for use within the car is followed. Hamburg goes a step further on its rapid transit system and paints a map of the route on the ceiling.

Automatic Crossing Gate Developed by North Shore Line

ELECTRIC highway crossing gates which are lowered automatically by the approaching train itself by completing a track circuit have been in operation without a single failure for more than two months on the Wheeler Road crossing of the Chicago, North Shore & Milwaukee Railroad, near Libertyville, Ill. The gates were installed as an experiment and are proving even more reliable than those operated by hand.

There are two gates, 10 ft. long, operated by electric motors. They are placed on the traffic sides of the highway approaching the crossing and are equipped with warning bells and red signal lights. Two signal relays are sufficient to operate them. The track circuits

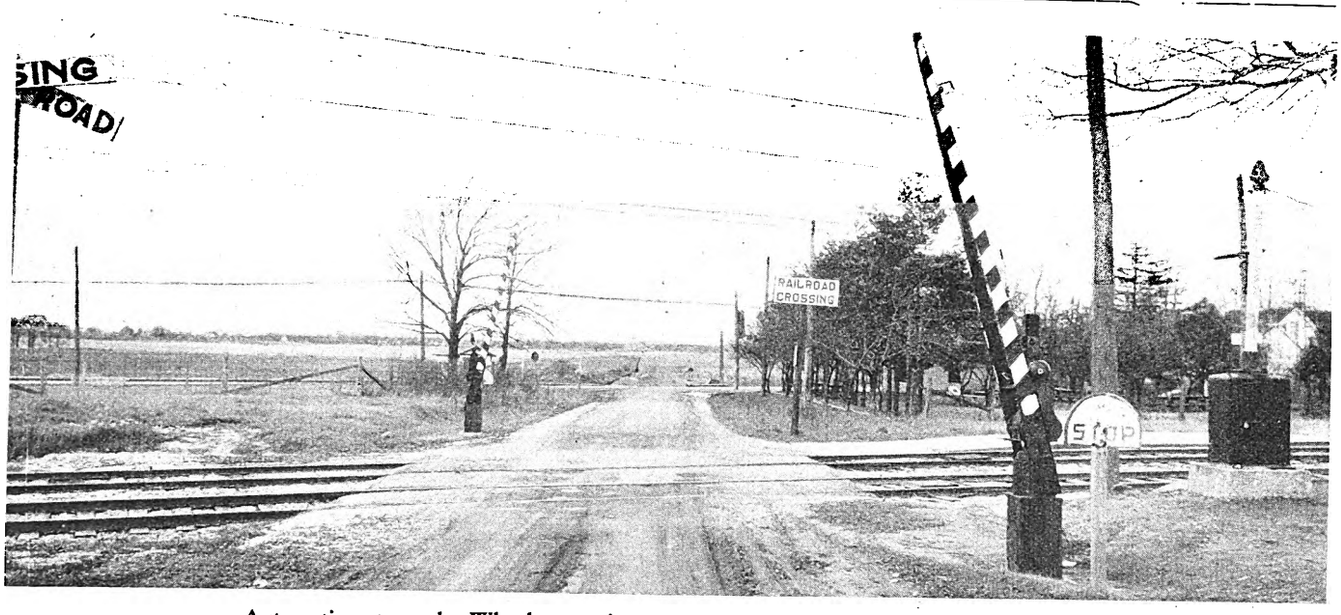
The gate is flexibly supported so that it is swung aside by an automobile without damage, afterward returning to its normal position

controlling the gates can be extended to any distance away from the crossing. Warning can be given at least 35 seconds in advance of a train at the highest speed operated. At this particular location the circuit is completed by approaching trains when 2,200 ft. from the crossing.

The approaching train operates the relays, which start the warning bell and the signal lights at from eight to ten seconds before the gates are lowered. Should an autoist fail to regard the signals and crash into the gate the impact would not damage the gate, but would swing it around parallel to the road. Springs in the upper case of the gate posts provide for such emergencies. The gates would not be in the path of the train as their base is set back far enough from the track. After the automobile passed the gate would swing back to its normal position. The gate mechanism would not be injured should the gate drop directly on an automobile, as it has sufficient slack in its parts to relieve the strain on its motor. The danger of a failure is reduced to a minimum as the track circuits employed are the same as the standard signal circuits.

For the purpose of accurate tests, the relay box is now equipped with a needle indicator, having a chart graduated into fifteen-minute periods. It is operated by six dry cells and is connected with a mercury tube on the gates. When the gates are lowered the mercury closes contacts and completes a circuit which operates the indicating needle on the chart. Thus a record is kept automatically of the time each train passed and

Digitized by Google

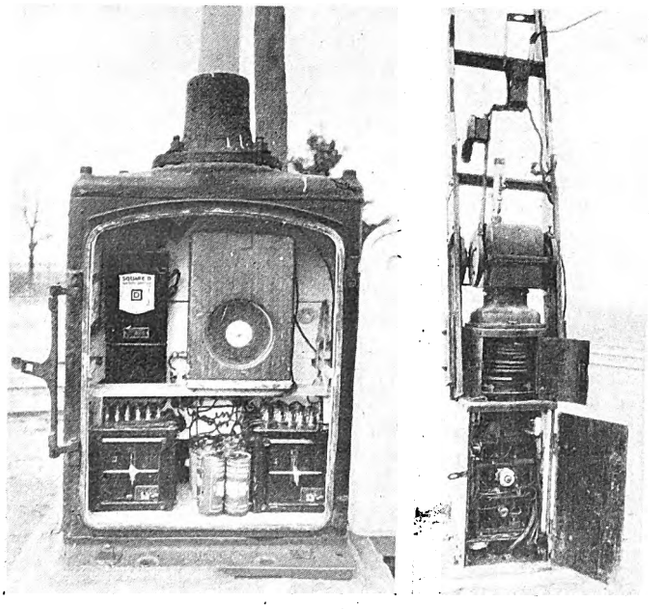


Automatic gate at the Wheeler crossing on the North Shore Line in normal position. It is lowered by a motor on the base controlled by a track circuit

whether or not the gates functioned at that time. A signalman needs to make but one trip in 24 hours to change charts and inspect the gates.

W. G. Fitzgerald, signal supervisor, is planning for a reserve source of power to be used in case of emergency. The gates are now operated by commercial alternating current. Should a failure occur on the a.c. circuit operating the gate motors, due to lightning or other causes, a power-off relay, operated by direct current from the trolley, would instantly set signals against approaching trains. The actual failure of the a.c. circuit itself would cause the power-off relay to set signals against trains.

Although still in the experimental stage, the new gates give promise of solving the old problem of furnishing crossing protection without the risk of the uncertain "human element" and without the prohibitive cost of elaborate automatic gates. Various forms of this gate have been used before by other railroads, but they necessitate manual operation. It is believed that the North Shore Line is the first to use this particular type of automatic gate.



At left, interior of relay box, showing both relays, the indicator and its batteries. At right, interior of the gate post for the automatic highway crossing gate. Below is the motor operating the gate; above are the springs which allow the gate to swing sideways when struck by a vehicle

Twenty-one Waiting Stations for Passengers in St. Louis

LOCATED at various points on the property, the St. Louis Public Service Company now has 21 combined shelters and refreshment stands, according to the brief submitted by it for the 1927 Coffin Prize. They are in the outlying districts, as well as at the more important intersections and transfer points where passengers are apt to be waiting for cars, and are built on company property.

They were built under the late receivership and after one station, so established as an experiment, had proved successful. This station was erected at the terminus of one of the lines where the company had maintained an open shelter of the sort usually found along electric lines in such districts. To improve this condition it offered ground at a reasonable rental on which the lessee was to erect at his own expense a modest structure where coffee, soda, beverages, confections and tobacco could be sold and space would be provided for a waiting room for passengers. The building to be erected by the individual remained his property and the lease stipulated that on termination of the lease the lessee would remove the building and replace the property in the same condition as he found it. In other words, the company was to furnish the customers for his business and in return he was to furnish, at his expense, the quarters to shelter the passengers as well as his own electric light, water and heat. In many of these buildings the tenant also furnishes the toilet facilities.

Arrangements like these now not only provide the 21 waiting stations for passengers mentioned but also bring in an income to the railway company from ground rentals of about $4,000 per year without any expense whatsoever to the receiver. The leases are drawn for a short period only and may be terminated by the receiver at any time that the ground may be needed for other purposes.

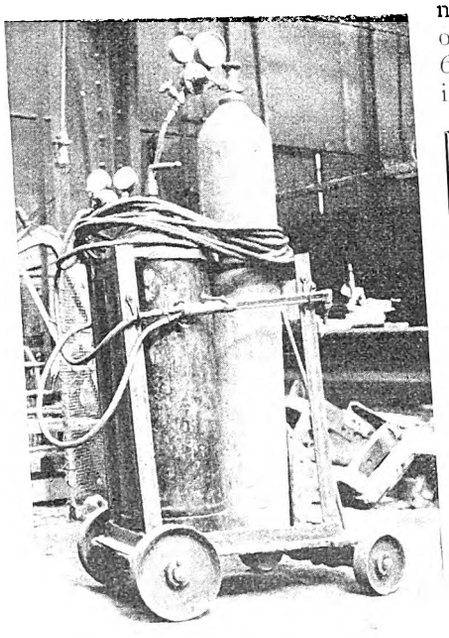
Maintenance Methods *and* Devices

Truck for Welding Outfit

DUE to the accidental destruction of the hand truck purchased originally with the oxyacetylene outfit used in the Woodside shop of the New York & Queens County Railway, New York City, it was found necessary to construct immediately another truck in order that the welding work would not be delayed. The truck shown in the accompanying



This truck was cheap to construct and has given excellent service

illustration was designed to meet this emergency. It was built out of standard structural shapes easily obtainable.

The platform of the truck is made from a solid piece of ½-in. plate, 30 in. long and 16 in. wide. Square axles made of 2-in. stock are equipped with rear wheels of 10 in. diameter and 2 in. face and front wheels of 7 in. diameter and 2 in. face. The wheels are spaced at 20½-in. centers and the axles 22-in. centers. The rear axle is bolted to the platform and the front axle to a horizontal round plate which makes contact with a similar plate fastened to the platform. This provides a swivel bearing for free circular movement. Four pieces of 2-in. angle are welded to the platform, forming a base structure 25 in. long and 13 in. wide. A 2-in. angle 25 in. high is welded to each corner of this base. These four angles are reinforced by a ⅜x2-in. flat bar welded to the top of the uprights on the 13-in. sides and two ½x1-in. flat bars shaped to fit the contours of the truck and welded to the uprights on one of the 25-in. sides. A ⅜x1-in. bar shaped to fit the truck is placed on the other 25-in. side. This fits into clips and is removable to allow for the replacement of the ¼-in. round iron hook installed on the front uprights which provides a support for the truck when not in use. For easy transportation of the truck there is a handle 4 ft. 6 in. long and made of ¾-in. round iron.

Speaking of "canned heat"—tie a can on your hot bearings and make it a full oil can.

Cleaning Systematized at Los Angeles

CAR trucks, together with various fittings, are cleaned carefully during overhauling at the shops of the Los Angeles Railway, Los Angeles, Cal. For preliminary removal of dirt and grease, a mixture of cleaning solution with steam under pressure is sprayed over the trucks before the parts are dismantled. This is much quicker than the old method of scraping off the grease by hand.

All journal, axle and armature bearings are cleaned before going to the babbitting shop for rebabbitting. A tank 2½ ft. x 3 ft. x 5 ft. is used for small parts which can be handled without the use of a crane. The cleaning solution used in the tank comes in a powdered form and is mixed in a proportion to give desired results.

A larger tank 3 ft. 2 in. x 5 ft. 8 in. is used for large, heavy parts such as motor frames, gears and complete rear ends of buses. Nuts, bolts, trolley wheels, washers, journal and axle bearings and other small parts are placed in a heavy wire mesh basket and lowered into the tank.

The three tanks used in connection with this work are heated with steam radiating coils of sufficient size to bring the solution to the boiling point in about 30 minutes. Parts are left in the tanks from 30 minutes to three hours, depending on their condition.

Setting Poles Under Heavy Traffic Conditions

By R. M. Cobb
Construction Foreman Electrical Department, Pacific Electric Railway

UNDER very heavy traffic conditions a total of 79 poles were set in less than three days by forces of the Pacific Electric Railway on Ocean Avenue, Long Beach, Cal. Owing to the location, it was necessary that the poles be in true vertical position after the load of span attachment was applied.

The resulting strains on the poles due to the weight of the overhead construction were predetermined. With this quantity known the rake at which the poles were to be set for different span lengths was calculated and a curve was plotted for use of the line crews. The spans varied in length from 90 to 135 ft. and in consequence it was necessary to set the poles at different rakes for the different span lengths, so that when the load was applied the rake would just offset the normal deflection due to the load.

Holes for the poles 3 ft. square were dug by hand for the first 2 ft. Then the remaining 4½ ft. was dug by a machine in a circular form with a diameter sufficient to allow 6 in. of concrete between the base of the pole and the outside of the hole.

Special pike poles were used to line up the poles. The ones used consisted of a piece of round wood about 3½ in. in diameter and 12 ft. long, on the end of which was an iron fork, the tines being bent to a diameter slightly larger than the pole. These tines were covered with friction tape to prevent slipping.

Blocks were placed in the bottom of the hole far enough apart to catch the weight of the pole and still allow the drainage necessary to prevent accumulation of moisture and consequent deterioration from rust.

When the hole was ready the pole, 40 ft. long and weighing nearly 2,000 lb., was raised by a derrick and placed in the hole ready for alignment. In raking the poles against the span strain a 5-ft. straight edge was placed on the front side of the level with a graduated screw adjustment. This was used to obtain the proper

Digitized by Google

rake as was indicated on the plotted curve used by the crew. A variation of 0.1 in. in 5 ft. was obtained on some poles. This small variation was due to the small difference in length of span and consequent amount of weight support.

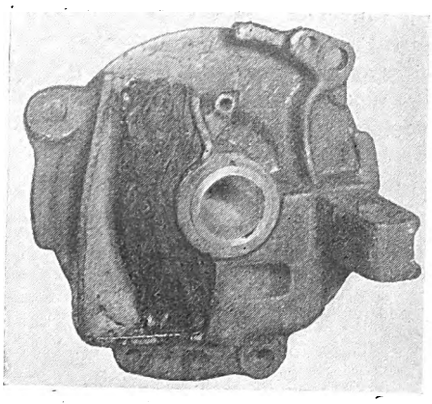
When the poles were raked properly the ells for street lighting conduits were placed by means of templets and the remaining excavation was filled in with concrete of a 1:2:4 mixture. About 1 cu.yd. of concrete was required for each hole.

Before taking the pike poles away it was necessary to support the pole in some manner to prevent the weight moving it out of alignment. This was accomplished by driving a wedge on the back side of the pole at the sidewalk line.

Proper Method of Packing Bearings

By Jesse M. Zimmerman
Renewal Parts Engineer Westinghouse Electric & Manufacturing Company

PROPER packing of bearings has an importance seldom appreciated. Bearings are often placed in service with improper packing. The function of the waste wick is to provide a direct path from the oil chamber to the window. When packing bearings the following points should be observed carefully:



Armature bearing housing with waste chamber cut out to show proper method of packing

1. A wick should be prepared from a good grade of long strand wool. This wick should be long enough to reach from the bottom of the oil chamber to the top of the waste chamber and should be wide enough to cover perfectly the entire area of the window.

2. The wick should be placed in the waste chamber so that it will reach from the bottom of the oil chamber and cover the entire window.

3. A sufficient quantity of waste should be tamped behind the wick, using care to force the wick firmly against the journal in the window.

4. A separate wad of waste should be placed on top of the main body of the waste to keep the dirt out.

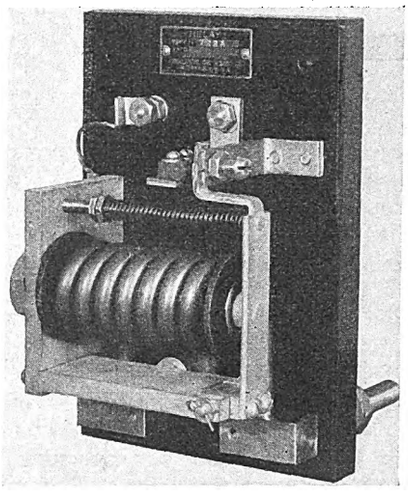
New Equipment Available

Motor Resistor Heater

CURRENT taken by car motors during acceleration is used for heating the interior of cars by means of a motor resistor heater just announced by the Consolidated Car Heating Company, Albany, N. Y. The heater shown in the accompanying illustration has one motor resistor heater unit and one standard sheath wire heater unit, mounted in the same casing. The motor resistor heater unit consists of an element containing a nichrome wire resistor embedded in insulating powder. This is subjected to a swedging process, whereby the outside diameter of the pipe is reduced, thus compressing the insulating material into a solid mass. Cast on the outside of the pipe is an aluminum fin to provide ample radiating surface for the heat generated within the resistor. This unit is secured to the heater by suitable clamps, one of which is a slip connection to allow for expansion and contraction of the element. The heavy lead wires are carried through the ends of the heater by porcelain bushings.

The motor resistor heater is an entirely new development in car heating and makes possible great economy in the use of current. The new and important function of the heaters is to remove the regular heater load from the peak load, and at the same time contribute a portion of the heat necessary to heat the car.

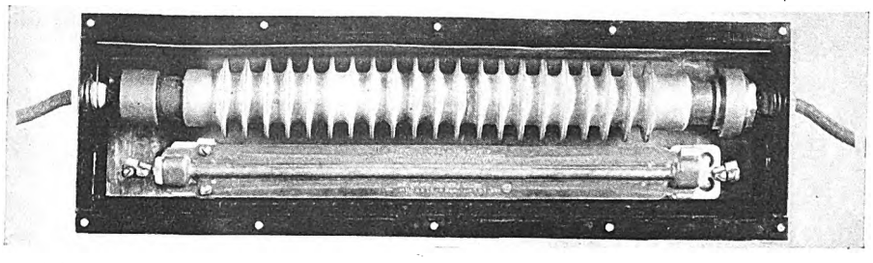
These heaters provide the resistance for the motors and have the same values as the external resistance mounted underneath the car, which is used in the summertime. Transfer from the inside to the outside resistors is made by means of a transfer switch. A peak load relay is in the resistor heater circuit. When the motor resistor heaters are operating, that is, when the car is being operated with the resistance in the motor circuit, the peak load relay is energized and short circuits the magnetic



Relay used to cut out car heaters when motor resistor heater is used

switch controlling the regular heaters, thus cutting them out. If the temperature of the car is below the temperature at which the thermostat cuts the heaters out, they will come into service again automatically as soon as the car motors cease to run on resistance.

The two sets of heaters are never in operation at the same time. The regular car heaters are cut out when the motor resistor heaters are operating, and they will be operating at all times when the motor resistor heaters are not operating, except when they are cut out by their thermostatic control. This effects a saving in two ways. First, by taking the normal heater load off the peak load of the car and consequently off the peak load



The regular heater spindle is shown at the top and the motor resistor heater unit at the bottom

Digitized by Google

of the power house; second, by supplying heat during the time that the regular heaters are cut out. This supplementary heat reduces the amount of current the regular heater equipment would take if the motor resistor heaters were not used. In other words, the peak load is reduced and the hourly consumption of electric heaters is also reduced.

The motor resistor heater shown in the accompanying illustration is of the panel type, but these heaters are also furnished in cross-seat and truss plank designs.

The safety heater switch used in connection with this equipment contains the fuses and cannot be opened when the switch is closed. Furthermore, the switch cannot be closed when the box is open. The switch mechanism is of the toggle type, with magnetic blowout, and a heavy barrier protects the fuses. The movement of the switch is such as to provide a good wipe at the contacts. An important feature of the construction is that the switch blade is thrown mechanically when it is opened. It is therefore impossible for the switch to remain in when the handle is thrown to the off position. These switches are furnished in various capacities up to 75 amp. at 600 volts. They are neat in appearance and every part is substantially constructed to withstand hard usage.

Run down brakes—
Break up cars.

Machines for Undercutting Commutator Segments

FOR undercutting mica between commutator segments of railway motors two machines have been introduced recently by the General Electric Company. One is a simple portable outfit which can be moved readily to any part of the shop and clamped to the armature shaft; the other is a stationary shop tool.

The portable outfit has adjustable stops which limit the travel of the saw to the brush surface of the commutator and is equipped with a floating drive shaft which permits the grooving of a number of slots at one setting of the armature. It also has an angular adjustment to compensate for commutator bars not exactly parallel to the shaft. A slight tap with the hand readily shifts the saw from slot to slot as the clamp is lined and will not mar the armature shaft. The driving shaft is equipped with universal toggle joints and can be furnished for either belt or motor drive.

The stationary machine has a base which is provided with adjustable pillow blocks having V-shaped bearing surfaces with brass rollers for carrying the armature. Both vertical and angular adjustments are provided, the latter adjustment to be used where the commutator bars are not exactly parallel to the shaft. The circular saw is mounted on the end of the motor shaft and is supported by an offset bearing, which permits the grooving of commutators having ears. Hand scrapers are designed and shaped to remove the fins on the mica insulation, also burrs and sharp corners on segments which are left in the grooves by the slotting machine. This work is done by drawing the tool along the slot after the commutator has been smoothed off by a No. 3 Stellite machine cutting tool. The commutator should be given a final polished finish with sandpaper and blown clean.

Portable Grinder and Buffer

BALL BEARINGS for the motor and roller bearings for the grinding spindle are features of a ½-hp. portable grinder and buffer just announced by the Hisey-Wolf Machine Company, Cincinnati, Ohio. This tool is equipped with the new Hisey two-pole switch which provides convenient control at the grip handle. The ½-hp. motor, constructed especially for heavy-duty service, is of the universal type operating either on direct or alternating current. An adjustable cast-steel wheel guard can be placed at any angle most convenient for the operator. The end cover is readily removable and affords quick renewal of grinding wheels.

American Association News

1928 Convention Goes to Cleveland

Selection made by policy committee after carefully weighing the possibility of completion of new convention hall at Atlantic City. Adequate car exhibit next fall considered vital to industry

CLEVELAND was again selected as the location for the annual convention of the American Electric Railway Association, which is to be held during the week of Sept. 22-28, 1928. This decision was reached at a joint meeting of the policy committee and the sub-committee on convention contract held at association headquarters in New York on Dec. 16.

The decision was made only after the fullest investigation, study and discussion by the several committees which have had the matter of plans and location for the 1928 convention in hand. There was a considerable sentiment in favor of Atlantic City as the convention location, attributable largely to the natural attractions of the seashore resort. There was, however, grave doubt as to the wisdom of selecting the next convention location on the basis of Atlantic City's general popularity, with no definite assurance of the completion of the new convention hall there and particularly in view of the assured superior facilities in Cleveland for a representative exhibit of progress in cars and equipment. Such an exhibit, it was felt, is of vital importance at the present time because of its influence in stimulating the recovery and rehabilitation of the industry.

The committee had great doubt as to the actual completion of the new Atlantic City exhibit hall in time for the 1928 convention. Even if the actual construction work were completed by close adherence to the best possible schedule, the task of staging a large convention, such as that of the American Electric Railway Association, immediately after the completion of actual construction work would be attended with many difficulties and complications, jeopardizing the success of the convention. The occurrence of any unexpected delay in the construction program, on which there is still a large amount of work to be done, might easily delay completion of the new hall in Atlantic City until after the 1928 convention date. The substitute facilities available, in the event this should happen, were not considered satisfactory by the committee, and it therefore decided that the best interests of the industry and the association dictated the selection of Cleveland again for the next convention.

J. H. Alexander, president Cleveland Railway, and L. C. Dickey, manager of the Cleveland Public Auditorium, described the new facilities which will be available in that city next fall. New wings have been added on the north and south ends of the auditorium and a new entrance has been arranged. A number of large and attractive meeting rooms will be available in the new wings, and it will therefore be unnecessary to use any part of the annex for meeting rooms as was done in previous years.

Action of the joint meeting of the policy committee and the sub-committee on convention contract in selecting the convention location completes the preliminary work for the next convention which was taken up immediately after the last Cleveland meeting. The committee on convention location held its meeting in November, when it was decided that the 1928 convention would include exhibits. This committee also set the date for the last week in September. At that time, options expiring Jan. 1 were secured on the Cleveland Public Auditorium and on the new auditorium in Atlantic City. Because of the uncertainty then existing regarding the date for completion of the Atlantic City building final choice between Atlantic City and Cleveland was left to the policy committee. Since the meeting of the latter was held only a short time before the expiration of options, it was impossible to delay decision until more definite assurance of the completion of the Atlantic City building could be obtained. A delegation headed by A. H. Skeen, manager of the Atlantic City Convention Bureau, outlined the situation regarding the facilities there, and a separate report was made to the committee by independent engineers who had made a study of the building operations. The committee made its decision after full investigation of the Atlantic City and Cleveland proposals.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Jan. 6 — **Metropolitan Section, A. E. R. A., Engineering Societies Building, 39 W. 39th Street, New York, N. Y., 8 p.m.**

Jan. 16-17—**Midwest Electric Railway Association, Hot Springs, Ark.**

Jan. 18-19—**Kentucky Association of Public Utilities, annual meeting Brown Hotel, Louisville, Ky.**

Jan. 18-19—**Central Electric Traffic Association, Hotel Gibson, Cincinnati, Ohio.**

Jan. 25—**Central Electric Railway Master Mechanics' Association, Hotel Gibson, Cincinnati, Ohio.**

Jan. 25-27—**Electric Railway Association of Equipment Men, Southern Properties, Roosevelt Hotel, New Orleans, La.**

Jan. 26-27—**Central Electric Railway Association, Hotel Gibson, Cincinnati, Ohio.**

Jan. 31—**New York Electric Railway Association, annual meeting. Hotel Commodore, New York, N. Y.**

SEPT. 22-28, 1928

American Electric Railway Association, 47th annual convention, Cleveland, Ohio.

Rail Corrugation

RESULTS of a study of wheel-rail contact pressures were presented at a meeting of way and structures committee No. 12 on rail corrugation held at association headquarters, New York City, on Nov. 28. Data for these studies were secured by permitting one wheel of a car to run over a strip of manila paper. A relation between paper thickness and compressing force was established by some tests in a compression testing machine. The study showed that even with new rails and car speed of 10 or 12 m.p.h. the wheel-rail pressures are likely to vary between ranges of the order of one to four.

As to the corrugraph data on the track sections which are now under observation it was decided to secure three more sets of corrugraph readings: One set to be taken before the first of the year, another set early in the spring and a last set some time in June. With reference to the analysis of these data it was decided that it should await the June collection of data.

In the remaining work on the sections which are now under observation it was suggested that pains be taken to observe:

1. If the corrugation waves, where both rails are corrugated, have their crests opposite each other or whether a crest on one rail is opposite to a valley on the other rail.

2. The rate of growth of corrugation, if such a thing as growth exists, along the rail in both directions.

With reference to experimental track sections it was suggested that committee members representing operating com-

Digitized by Google

panies should, when it is feasible to do so, in building new track or reconstructing old track, try out the various mitigating methods suggested in the report of the committee for last year. Among the mitigating methods suggested were tilting of the rails to secure a more uniform wheel-rail contact, planing of the rail head at the mill, grinding of the rail surface after the track is constructed but before cars are operated over it.

Attention was called to the fact that the Pittsburgh Railways is building some track with planed rails.

Mr. Williams suggested taking up some of the rails in a section which now corrugates badly and rebuilding the track following the several suggestions for corrugation mitigation.

Mr. Wysor suggested building a toy or small scale experimental railroad for investigation purposes. This matter was discussed at some length but no formal action relative to it was taken. It was suggested that the secretary request Messrs. Lavan, Fehr and Nardini to look over the resilient track which is being tried out in Denver in case they happen to visit the Denver property.

Mr. Ormondroyd reported that with the co-operation of the Pittsburgh Railways he had made some observations on track deflection, but as these observations were not very satisfactory he is planning to secure a second series of deflection readings. He also reported on some tentative calculations on track and rolling stock vibration periods.

The secretary also reported some data secured from vibration calculations.

It seems from the work so far done that both vertical and torsional vibration frequencies come within the zone of frequencies likely to assist in the production of corrugation.

From the calculations so far made it does not appear that the gyroscopic action of the wheels is an important contributing factor.

The foreign committee's report relative to improvement of rail quality was discussed at some length.

In the matter of the rails, now in the track on Jefferson Avenue, Detroit, where the rails from one mill show a markedly greater tendency to corrugate than the rails from another mill, Mr. Williams agreed to prepare tension specimens according to A.S.T.M. specifications for Mr. Ormondroyd, who agreed to have them tested for total work of rupture in the testing laboratories of the Westinghouse Electric & Manufacturing Company. Mr. Williams agreed to furnish data relative to temperature variations of rails laid in paved track.

It was agreed that the chairman write Mr. Dalgleish, president of the Engineering Association, relative to the project and suggest that at least three more equipment men be appointed on the committee.

In connection with Mr. Fehr's suggestion of vibrograph studies on track over which new and present types of cars are operated, Mr. Ormondroyd agreed to make such studies as soon as the Pittsburgh Railways places its new cars in operation.

It was agreed that oscillographic studies of vibration of both track and rolling stock are advisable and that the committee attempt to secure the use of a suitable instrument.

The secretary presented the results of a study of wheel-rail contact pressures.

It was decided that another meeting of the committee should be held about May 1, 1928.

Members present were W. W. Wysor, chairman; C. H. Clark, H. J. Tippett, H. S. Williams, C. R. Kinnear, A. M. Nardini, J. Ormondroyd and D. D. Ewing.

Rectifier Committee Outlines Work for Year

SPECIAL committee No. 2 of the power division on mercury-arc rectifiers held its first meeting of the year at association headquarters, New York City, on Dec. 7.

After discussing the 1927 report on the subject of rectifiers, which was prepared by a sub-committee of the power generation and conversion committee, the committee decided to conduct its work for the present year on the following lines: (1) It will attempt to set up definitions and standards which will serve as a means of crystallizing the ideas of the committee members. (2) The committee will send out a questionnaire to bring up to date the information on rectifiers which was obtained by last year's committee. (3) The committee will keep in touch with all phases of the situation, putting special emphasis on new developments in design or operation.

Considerable time was devoted to the preparation of certain definitions of rectifier terms to be used in this work and in the preparation of its report. The committee agreed to include in this year's report another list of all rectifier installations.

Those who attended the meeting were H. W. Codding, chairman; C. E. Baker representing F. W. Peters, C. A. Butcher, C. L. Doub, W. S. Richhart and G. C. Hecker.

Accountants' Executive Committee Meets

TWO reports, one by Leslie Vickers, on the status of the depreciation hearing in progress in Washington, and the other by the association's representative at the recent Railroad and Utilities Commissioners' convention, were made at the Nov. 18 meeting of the Accountants' executive committee meeting, held at Pittsburgh, Pa.

The committee voted to invite J. H. Hanna, chairman committee on national relations, and Dr. Thomas Conway, Jr., chairman sub-committee on depreciation, to become members of the committee on standard classification of accounts, and announced the personnel of the joint committee on engineering accounting, as follows: L. T. Hixson, chairman; F. A. Healy, T. P. Kilfoyle, C. R. Mahan and Walter Shroyer.

Those present at the meeting were T. B. MacRae, president; J. E. Heberle, C. R. Mahan, E. A. Tuson, L. T. Hixson, J. W. Welsh, M. W. Glover and Leslie Vickers.

Way and Structures

LAYING out and planning work for the coming year constituted the principal business of the way and structures committee at a meeting held at association headquarters, New York City, Dec. 8. Those present were: H. H. George, chairman; C. A. Alden, C. W. Burke, C. H. Clark, W. R. Dunham, Jr., E. D. Eckroad, E. B. Entwisle, C. F. Gailor, W. G. Hulbert, Adrian Hughes, Jr., E. M. T. Ryder, C. A. Smith, A. T. Spencer and H. M. Steward.

In considering the specifications and standards now included in the Engineering Manual, the committee called attention of the chairman of special committee No. 1 to the advisability of considering advancing the classification of some of the specifications to that of standard.

Special committee No. 2 on trackwork held a meeting and decided on crossing designs for steam over electric railways. It was recommended that these be approved by letter ballot.

News of Other Associations

A.I.E.E. Nominations Announced

NOMINATIONS for the general officers of the American Institute of Electrical Engineers have been made by the national nominating committee. Election will be by letter ballot and the results will be announced at the annual meeting. The officers so elected will go into office on Aug. 1, 1928. The nominations follow:

For president, R. F. Schuchardt, electrical engineer Commonwealth Edison Company, Chicago, Ill.

For vice-presidents:

Northeastern district, E. B. Merriam, Schenectady, N. Y.

New York City district, H. A. Kidder, New York, N. Y.

Great Lakes district, W. T. Ryan, Minneapolis, Minn.

Southwestern district, B. D. Hull, Dallas, Texas.

Northwestern district, G. E. Quinan, Seattle, Wash.

For managers: A. E. Bettis, Kansas City, Mo.; J. A. Johnson, Niagara Falls, N. Y., and A. M. MacCutcheon, Cleveland, Ohio.

For treasurer: George A. Hamilton, Elizabeth, N. J.

News of the Industry

Authority for Subway Routes in Chicago Settled

As a result of the settlement of all differences between the City Council of Chicago, Ill., and the Board of Local Improvements in the question of authority in determining the location of the tubes, a matter which has delayed action for several weeks on the subway bill, the fifth and last of the railway enabling bill, this measure was approved Dec. 8 and copies of the bill forwarded to the companies. At a joint meeting at which Mayor Thompson, Assistant Corporation Counsel Breen and the two contending groups were present it was agreed that the Aldermen would have the power to decide on the routes of the proposed subway system, while authority over engineering plans and actual construction would be given to Michael J. Faherty, president of the local improvement board. A bill transferring to the City Council the right of location now vested in Mr. Faherty's organization is consequently being drafted by the corporation counsel. The Aldermen also voted to draft a supplementary bill providing for twenty-year special assessment bonds to finance the subway system instead of the five-year bonds now permitted by law, which would impose too great a burden upon property owners.

Fare Changes on Lines in Southern Michigan

During the year just drawing to a close a number of changes were made in the fare schedules of the Michigan Electric Railway Company and its subsidiary, the Southern Michigan Transportation Company, and the Michigan Railroad and its subsidiary, the Rapid Transportation Company.

In January, 1927, the rate of city fares in Lansing, Jackson and Battle Creek was 10 cents cash, four tokens for 25 cents; children's fare between the ages of five and twelve years, 5 cents with universal transfers. On the sixteen buses operated in Lansing the fare was 10 cents cash; children's fare between the ages of five and twelve years, 5 cents with universal transfers. In Kalamazoo the fare was 8 cents cash, four tokens for 25 cents; children between the ages of five and twelve years, 5 cents on cars and buses, with universal transfers.

Since then the management has induced the city officials in the cities just named to change these rates to 10 cents cash, three tokens for 25 cents, children between the ages of five and twelve years 5 cents, with universal transfers. These fares are the same on cars and buses.

The rate of fare on the Southern Michigan Transportation Company buses operating between Jackson, Battle Creek and Kalamazoo and between Jackson and Lansing was 3 cents per mile in January, 1927, but has been increased to 3½ cents per mile. No change was made in the rate of fare on the interurban cars operating between the stations just named, that rate remaining at 3 cents per mile.

The rate of fare on the Rapid Transportation Company buses operating between Kalamazoo and Grand Rapids and between Bay City, Saginaw and Flint, in January, 1927, was 3 cents per mile and has been increased to 3½ cents per mile. The fare on the interurban cars of the company operating between those points remains the same as before, 3 cents per mile.

The increase in fare on the interurban buses was brought about by filing tariffs with the Michigan Public Utilities Commission. An interesting sidelight is that the changes were received graciously by both the company's patrons and the newspapers.

The Denver Decision

Review of controversy now ended with ruling favorable to railway's contention for perpetual rights

UPHOLDING the federal district court, the U. S. Circuit Court of Appeals, as noted briefly in the ELECTRIC RAILWAY JOURNAL for Dec. 17, page 1127, handed down a decision in St. Louis on Dec. 8, declaring, in substance, the Denver Tramway's franchise perpetual. The ruling made final a district court decision restraining the city from enforcing its 6-cent fare ordinance. Circuit Judge Booth said:

> We agree with the conclusions that in neither the constitution of Colorado nor the statutes, nor the charter of the city of Denver, are to be found any provisions prohibiting grants without time limit.

The opinion failed to support only one minor finding of the lower court when it ruled that the value of the franchise grant under 1885 and 1888 ordinances is not essential to the questions at issue. The federal district court fixed the value of this franchise grant at $2,000,000. The high court said:

> We see no important reason for its inclusion in the decree, and since the city contends it is prejudicially affected by the finding and has objected to the inclusion of the findings in the decree, we think it should be eliminated. In other respects the decree is approved.

Thomas H. Gibson, attorney for the city, would not say definitely what the attitude of his office will be, but it was considered unlikely the city will try an appeal to the U. S. Supreme Court, inasmuch as this court refused to take jurisdiction last January.

The litigation just concluded began during the time of the World War, with the effort of the Denver Tramway to obtain a higher fare than the 5-cent one allowed in the 1906 franchise.

In 1918, the company appealed to the State Public Utilities Commission for permission to increase its fare. Shortly thereafter the commission granted the Tramway a 7-cent fare, but then the Supreme Court handed down its famous telephone case decision, holding that Denver is a home rule city and that, as such, the Public Utilities Commission had no authority over it.

At the company's request, the City Council then passed an ordinance granting the Tramway a 6-cent fare. About this time Dewey C. Bailey waged his campaign for election on a promise to restore the 5-cent fare. Following his election, the 6-cent fare ordinance was repealed, but the Tramway insisted a 5-cent rate was confiscatory and another ordinance was passed permitting the company to charge 6 cents.

The litigation then was carried into the federal court, where Judge Robert E. Lewis, then a federal district judge, granted the company its present 8-cent cash rate with two tickets for 15 cents. This award was carried to the Circuit Court of Appeals and upheld.

Judge Lewis made permanent an injunction restraining the city from enforcing its 5-cent fare demands, and this decision also was upheld by the high court.

The city and the company then began a long controversy over the valuation of the tramway, seeking to establish a basis on which return on investment might be figured. Henry A. Dubbs was appointed special master in chancery to set a valuation. Delos F. Wilcox was employed as the city's valuation expert and A. L. Drum as an expert for the company.

The company claimed valuation of $33,000,000, Mr. Wilcox contended for a valuation of $11,000,000, and Mr. Dubbs placed the valuation at $20,105,707, in October, 1923.

Attorneys for the tramway, appealed Mr. Dubbs' valuation to the federal court, and Judge Lewis, on Dec. 13, 1923, increased the figure to $23,514,769. At this time Judge Lewis decided the tramway franchise was perpetual, based on the grants of 1886 and 1888, but he

Digitized by Google

held that the 5-cent fare provision was not binding.

When Henry E. May became city attorney, he appealed to the U. S. Supreme Court, contending that if the company had a perpetual franchise, the 5-cent fare provision also must stand. Last January, the high court ruled it had no jurisdiction in the matter, and the case was sent to the Circuit Court of Appeals, with which Mr. May filed briefs April 20, 1927.

The decision rendered on Dec. 8 was a rejection of the city's contention as carried in Mr. May's brief.

As things now stand the company would appear to be entitled to earn a return of 7½ per cent on a valuation of about $21,000,000. The present return is approximately 3.9 per cent, reports show, while patronage of tram lines has shown a steady decrease for several years. The problem before the directors, who are scheduled to meet in regular session on Dec. 29, will be to consider a fare which will provide a proper return without becoming too great to cut further into patronage. Figures made public recently, showed a drop of 6,000,000 fares in three years.

An Advertisement Tells of Progress

In announcing its plan to control taxicab cruising in Philadelphia, Pa., to which reference was made in the JOURNAL for Dec. 10, page 1080, the Philadelphia Rapid Transit Company recently ran advertisements in the daily papers of the city telling of the further steps which have been taken "in the interest of the 80 per cent" with the establishment of cab stands at nearly every street car stop in the business district. The company, owner of the Yellow Cab Company, expresses its belief that the new plan will assist in speeding up traffic for everybody and make Yellow Cab service more accessible than before. In its advertisement the company recognizes the slight change in the taxicab habits of the cab riders who will go to the nearest car stop for a cab instead of hailing one on the street. The co-operation of all is sought in an effort to make the new plan a success—"to speed up traffic for the 80 per cent."

Downtown Parking in Oklahoma City Prohibited

The Oklahoma City, Okla., City Council has adopted an emergency ordinance abolishing double parking of automobiles in the downtown district. Cars unable to park at the curb may stop only long enough to discharge or take on passengers. It is believed that this will stimulate use of the electric railway cars, which, while not the purpose of the City Council, would be gratifying to many citizens, who consider the Oklahoma Railway essential to the proper movement of traffic of the city and are anxious to see the local railway property restored fully to its former prosperous condition.

Several months ago this property passed into the hands of local investors.

Safety Zone Stop Ruling in Minneapolis

A traffic ordinance effective Dec. 6 in Minneapolis, Minn., gives a definite limit to street car stop safety zones of a strip 4 ft. wide adjacent and parallel to the tracks, as long as the longest street car or street car and trailer. Except where there are safety zones, drivers of automotives must come to a full stop at least 10 ft. behind the street car until gates are closed. Drivers may pass at a reasonable speed to the right of safety zones, but never through them. Drivers may never pass a street car moving in the same direction to its left except where there is a one-way street.

Hearing on New York Labor Injunction Plea Jan. 23

Supreme Court Justice Wasservogel announced on Dec. 16, after a conference with the attorneys, that the hearing of the injunction suit by the Interborough Rapid Transit Company against the American Federation of Labor and its officers to restrain them from attempting to organize the Interborough employees, has been postponed from Dec. 21 to Jan. 23.

The adjournment was taken, it was said, because the papers in the case are so voluminous that more time will be needed for preparation before arguments are heard. Counsel for the labor organization will have until Dec. 24 to file answering affidavits, and counsel for the Transit company until Jan. 5 to file theirs.

Profitable Investment in Display Signs in Atlanta

A device that has proved a great convenience to car patrons of the Georgia Power Company was recently put in use by the new Jacobs Pharmacy at Peachtree and Ellis Street, Atlanta, Ga. A large display board has been placed at the rear of the store where it can be seen by all customers. Whenever a street car approaches the fact is signaled on the board with the information whether the car is bound north or south. It is operated by a colored porter who stands outside the store and presses a button when he sees a car coming from either direction, but it has made the store a rendezvous for all passengers on this particular line.

Patrons do not have to wait in the rain watching for a car, nor do they have to run to the door every two or three minutes to see if a car is coming. The signal gives them plenty of warning and tells them what car is coming. This system, it is said, has brought in many new customers to the drug store.

Questions $7,000,000 Items in Interborough Accounting

New York City's Transit Commission, in demanding that the Interborough Rapid Transit Company amend its accounts covering subway operating contracts with the city, questions the propriety of certain items charged to the cost of operating the subway. Chairman Gilchrist notified the company that the commission has questioned items totaling more than $7,000,000 in its accounting and asked the company to inform the commission whether or not the company will refrain from collecting anything more on the accrued preferentials of about $4,800,000, pending settlement of the accounting items in dispute. The commission contends that the accrued preferentials will be wiped out by the adjustment of these controversial items.

President Hedley of the company said:

> The contract between the city and the company provides that the commission may object to any expenditure as unreasonable or improper, whereupon the amount is held in a suspense account until the item in dispute is adjudicated by arbitration. If the determination of the arbitrators is that the expenditure is reasonable and proper, the amount must be charged against the proper account; otherwise the amount, with interest, must be borne by the Interborough and deducted from the accumulated deficits.
>
> The Interborough does not concede that any item in its charges for expenses has not been actually and necessarily incurred in the operation of the subway. Differences of opinion might naturally arise as to whether certain expenditures should be charged to operation or to the company. For illustration: The expenses of the consulting engineers for their examinations in connection with the readjustment of the Manhattan Elevated rental some years ago are debatable either way. It is for just such items that arbitration is provided. It is not expected that any board of arbitrators will sustain the contention now advanced by the commission to anything approaching the amount recently claimed in conference, and which is set forth in the letter I have received.
>
> As the matter presently will be submitted to a fair and impartial tribunal for determination, it will be advisable to reserve discussion of details until a hearing before the arbitrators.

Another Ticket Privilege in Alliance

The week-end pass, good for unlimited rides over the entire division of the Stark Electric Railway, Alliance, Ohio, on Saturday and Sunday is being issued in an effort to stimulate week-end business, including Saturday night trips to nearby cities for shopping and shows, and for week-end visits. According to E. W. Sweezy, general manager, the new pass will be sold for $1. It will be good over the entire system of 35 miles.

With this addition, the "ticket family" on the Stark Electric now has twelve members, including nine weekly passes, the Sunday, daily system and week-end permits.

President Shannahan Outlines His Policy for Omaha

John N. Shannahan, the new president of the Omaha & Council Bluffs Street Railway, Omaha, Neb., has assumed the duties of his position. In a statement to the press he said that the problem in Omaha appeared to be no different than it was in other cities he cited where intensive application of modern methods has restored companies financially. His first word to the people of Omaha was that the company is the servant of the public, and he would endeavor to have it so regarded by them. The company, he says, wants the Omaha public to ride the street cars. His efforts will be directed toward supplying service that would bring this about.

Lower Fare to Atlanta University

The Public Service Commission's order for new fares in Atlanta, Ga., on the lines of the Georgia Power Company has been revised so as to bring about a reduced rate between Atlanta and Oglethorpe University. In the order affecting the Oglethorpe University line the old fare of 13 cents, with privilege of transfer, will be replaced by a 10-cent fare without the privilege of transferring to another line. If a transfer is desired tickets will cost 13½ cents, while cash fares will be 16 cents. The old fare of 6 cents from Buckhead to Oglethorpe will not be increased, as was provided for in the original order of the commission.

Gary Operators Join Classes

Twenty-three operators, trainmen and linemen of the Gary Railways, Gary, Ind., have enrolled for the course in elementary electricity, which is being given free to employees by the company. Classes will be conducted in the Public Service Building every Tuesday night by Howard Ayers, member of the staff of instructors in electrical engineering of Purdue University.

Subway Budget Item Disallowed in New York

The decision of Supreme Court Justice Wasservogel, directing the Board of Estimate of New York City to eliminate from the 1928 budget the item of $13,000,000 for amortization of one-fourth of a proposed issue of $52,000,000 of four-year subway construction bonds, was affirmed unanimously on Dec. 16 by the Appellate Division. The decision not only declared that the $13,000,000 item had been placed unlawfully in the budget, but sustained the Citizens Union's contention that the certificate of the Controller as to the necessity of the appropriation was necessary.

The Appellate Division's decision is the second set-back for Mayor Walker and the majority of the Board of Estimate in their efforts to put through the plan of financing subway construction proposed by John H. Delaney, chairman of the Board of Transportation, and reduce the overhead on the cost of the city's new subways, sufficiently to permit the city to maintain the 5-cent fare on the lines which it is intended the city shall operate.

So the Shippers Might Understand

Completion of enlargement of Columbus freight terminal turned to advantage by railways to tell story to shippers
General discussion at dinner

THE completion of the enlargement of the Columbus freight terminal was the occasion for an inspection and "get-together" party at Columbus, Ohio, on Oct. 27, attended by traffic representatives of the most of the electric railway properties of Ohio, Indiana and Michigan, shippers of Columbus, Ohio, representatives of civic organizations in Columbus and officials of the Indiana, Columbus & Eastern Traction Company, who sponsored the party.

During the summer additions were made to the freight house and yards, consisting of an extension to the freight house, 41 ft. wide and approximately 65 ft. long, which increased the floor space 65 per cent and door capacity 70 per cent. The yard capacity was increased to accommodate 30 cars.

The effect of these changes was immediately noticeable. Overnight service traffic between Columbus and Springfield, Cincinnati, Dayton, Fort Wayne, Detroit, Cleveland and many intermediate points began to pick up. Unsolicited reports from shippers indicated that they were highly pleased with the new service. Complaints from the connecting lines, regarding congestion, at this point, were no longer received.

The officials then decided that the achievement of the Columbus Interurban Terminal Company (the holding company of traction terminals in Columbus) should be fittingly celebrated. A "get-together" meeting and inspection party was planned and letters of invitation were sent to traffic and managing officials of connecting Ohio, Indiana, and Michigan lines, shippers and representatives of civic organizations in Columbus. Later, illustrated invitations were mailed giving the complete program for Oct. 27.

The meeting during the day was presided over by W. R. Huffer, traffic manager of the Indianapolis, Columbus & Eastern Traction Company, who also conducted the tour of inspection through the freight terminal and yards. Following the luncheon at noon the guests were taken for a tour of the capital in special buses of the Dayton & Columbus Transportation Company, a subsidiary of Indiana, Columbus & Eastern Company. The new O'Shaughnessy Dam, Ohio State University grounds and commercial districts were viewed, and the tour ended at the Elks Country Club.

At 6 o'clock dinner was served at the Country Club, and, acting as toastmaster of the occasion, J. M. Pogue, general manager of the Indiana, Columbus & Eastern Company, endeavored to sponsor the "get-together" spirit which was prevalent in the meeting and stressed the various freight activities of interurban lines in the territory. Emphasis was laid upon the fact that the lines were being called upon to furnish considerable freight equipment for handling carload business, particularly cement, as two large plants are located at Osborn, Ohio, viz., the Southwestern Portland Cement Company and the Wabash Portland Cement Company.

The meeting was turned into a round-table discussion and compliments from the Columbus shippers and Chamber of Commerce officials regarding the service of the electric lines were enthusiatically received by the guests. Expressions of the Columbus shippers were to the effect that fast and efficient service, as had been built up by the electric lines, would continue to build up the electric freight business and the consensus of opinion seemed to be that many shippers were sending every possible pound of freight via the electric lines.

Various traffic officials had an opportunity to state their problems and to outline what their individual properties were planning for the coming year in the fields of solicitation, advertising and improved operating facilities. Discussion centered on the thought of greater co-operation and improved service, during the coming year as affecting the interurban properties and the shippers of the Central electric territory.

The concensus of opinion is that the groundwork was laid at this meeting for further co-operation with all electric lines in the territory. That was the desire in the first instance, and the belief exists that the gathering was more than partially successful in this respect.

Another Move in Des Moines One-Man Car Case

The Des Moines City Railway, Des Moines, Iowa, lost its final attempt to break loose from compulsory two-man car operation when the Iowa Supreme Court on Dec. 17 refused the company a rehearing in its case against the street car men's union.

The high court had previously upheld the Polk County District Court in ruling that the 25-year agreement between the union and the company making two-man car service obligatory is bind-

Digitized by Google

ing in all of its features. The agreement was signed in 1915.

However, in spite of the Iowa Supreme Court's refusal to reopen the case, the decision of Dec. 17 is felt to have but little actual bearing on the situation as it exists now. The Des Moines City Railway has been in receivership since Nov. 11, this year, and Federal District Judge Martin J. Wade has empowered the receivers to terminate any contract affecting operations which involves either labor or materials.

So far the receivers have given no inkling as to whether they will institute one-man cars. However, F. C. Chambers, operating receiver and president of the company, has stated repeatedly that the company could save from $250,000 to $300,000 annually by substituting service with one-man cars. With the company facing an operating deficit of $129,000 for 1927, it is generally agreed that nothing short of one-man cars will save the day.

More Facts in Galveston Fare Case

Additional data in connection with the application of the Galveston Electric Company, Galveston, Tex., for an adjustment in car fares have been presented to the City Council by R. G. Carroll, general manager. The board was asked to consider the value of property used for transportation purposes "upon which we are entitled to earn a fair return." The company declared that the actual cost of property used to furnish railway service in Galveston was $2,170,718 on July 31, 1927, and that since that time $88,000 in capital expenditures had been made for railway purposes, including $65,000 for new cars.

Some weeks ago the company asked for an increase in fares on the basis of four tokens for 30 cents, a straight 10-cent fare or the purchase by the rider of a 25-cent weekly ticket, the holder of which would ride each time for an additional 5 cents. This compares with the present fare of 6 cents.

Improvements to Be Made by Reading Transit

A contribution of $43,666 toward the cost of eliminating a grade crossing in the Borough of Bridgeport, Pa., has been demanded of the Reading Transit Company by the Pennsylvania Public Service Commission. A major portion of the money to be paid by the railway will be for the reconstruction of its tracks made necessary because of the improvement.

The commission directs the company to pay $37,161 for these track relocations in the borough. The railway also must pay $5,000 toward the cost of building the new bridge which will eliminate the grade crossing. The company also is to contribute 1 per cent toward the cost of taking property for the improvement. These property damages are estimated at more than $150,000 which will make the company's share about $1,505 for that item. A crossing over four tracks of the Reading Company is to be abolished by the construction of a bridge. The estimated cost of the work is $258,872, of which amount the electric railway will contribute more than $42,000. The property damages are additional to the other costs.

Isn't That the Truth?

THERE is nothing sacred about a nickel in the street car business; there is nothing, either, that would definitely fix 10 cents as the limit. Those who ride the car lines will have to pay what it costs. Chase the matter through arguing between company and Council, chase the issue through the courts, chase it anywhere you please, and, in the end, that is what it will amount to. If railway service functions, it must be paid for. That part of the matter is inescapable.

—*Lansing Journal.*

New Uniforms for Safe Records in Memphis

Approximately 100 trainmen of the Memphis Street Railway, Memphis, Tenn., will be presented with new uniforms and caps as Christmas gifts by the management. Their records disclose no accident which cost the company money within the past year. A. D. McWhorter, general superintendent, said it was an expression of appreciation to 40 per cent of the trainmen who have had no accident, causing damage claims.

More Than 2,500 Boston Cars Replaced

The Boston Elevated Railway, Boston, Mass., owned, at the time the property was taken over by the public trustees in 1918, 3,372 surface cars, of which 1,354 were open cars, leaving 2,018 closed cars. At that time, the use of the open cars had been entirely abandoned and their value was negligible. The number of surface cars owned Dec. 31, 1926, was 1627, which was a shrinkage of 391 in the number of such cars owned in 1918. The book investment in both rapid transit and surface cars on July 1, 1918, was $17,427,000, as against a book investment in 1926 of $24,628,000. This increase was provided for by the proceeds of the issue of securities and by the depreciation reserve, or by proceeds from the sale of the Cambridge subway. Of the original surface cars owned in 1918 there remained only 842 on Dec. 31, 1926.—*From statement of committee reporting on Boston Elevated.*

St. Louis Company Meets Patrons "On the Air"

To popularize its service with the inhabitants of St. Louis and vicinity the St. Louis Public Service Company, new owners of the street railway system in St. Louis, Mo., has taken to the air. The company has engaged prominent quartets of St. Louis to give programs via Radio Station KMOX, the "Voice of St. Louis."

In the initial hour of the St. Louis Public Service Company air career the Pilgrim Quartet featured Christmas carols and other songs suitable to the holiday season.

William E. McCoy Has Enviable Record

To commemorate his 35-year service record William E. McCoy, veteran street car motorman of the Roanoke Railway & Electric Company, Roanoke, Va., was presented a service pin at a recent meeting of the employees. The pin is studed with seven diamonds, one for each five years of his time with the company.

Since early in 1894 Mr. McCoy has been running on the Salem line and in the intervening years has become well known to thousands of patrons. Offered opportunities for advancement, he passed them by satisfied with the genuine pleasure he found in the train service.

In commenting on his experiences the Roanoke *Times* says that Mr. McCoy has profited by what has crossed his vision.

Curtis Bay to Be Tapped by Washington-Baltimore Line

The Washington, Baltimore & Annapolis Electric Railroad has decided to build a branch line into the Curtis Bay District near Baltimore. Rights of way have been acquired by the company and the Public Service Commission may soon be asked to approve construction of the line. The branch probably will run from Shipley Station, on the main line, to the junction of Cabin and Curtis creeks.

Belt Line Project in Oklahoma City Awaited

With the termination of the receivership of the Oklahoma Railway, Oklahoma City, Okla., efforts will be made at once to build a belt line, a project which met with much opposition when

Digitized by Google

first proposed. Arrangements for financing the belt line were completed recently by Hubert R. Hudson. At the time, Mr. Hudson arranged to meet almost $1,000,000 in junior mortgage bonds which are due Jan. 1, 1928.

One-Man Cars to Continue on Stark Electric

The state ban against one-man cars on the Stark Electric Railroad, Alliance, Ohio, has been lifted. General Manager E. W. Sweezy, appearing before the Ohio Public Utilities Commission at Columbus, was assured that the state citation, received a short time after two interurban cars had crashed near Sebring, would be indefinitely deferred.

Appearing before the officials with records of one- and two-man operation, covering a period of twelve years, Mr. Sweezy gave his reasons why the company should not be compelled to discontinue one-man operation until a block system had been installed. The figures showed that under two-man operation an accident was recorded every 530,000 miles, while with one-man operation there has been only one wreck in approximately 1,250,000 miles.

While the state department has not ordered the installation of a block signal system, this is being planned for the near future, according to Mr. Sweezy. Next summer, it is believed, business on the line will warrant the additional cost for installation over part of the division.

Strike Continues on Schuylkill Railway

No report of material progress in the status of the Schuylkill Railway strike emanates from that territory. On Dec. 9 a conference was held in Philadelphia between the receivers and representatives of the men through M. A. Kilker, a lawyer of Girardville, Pa., who made an earnest plea for settlement. These efforts so far have proved unavailing, though Mr. Kilker is still endeavoring to promote this purpose.

The differences between the receivers and the men relating to the wage scale were satisfactorily adjusted, but the men, at a subsequent meeting, rejected the offer as a whole because the receivers found themselves unprepared and unable to extend the agreement with the railway men to include bus men of a separate corporate organization over whom they had no control or influence.

California Franchises Granted

The City Council of Richmond, Cal., has passed the ordinances of the Key System Transit Company authorizing three new franchises for the local lines in Richmond. These 50-year grants are effective on a new basis which relieves the company of much of the burden of paving its right-of-way and of track reconstruction.

Safety Bonuses Awarded to Brooklyn Operators

Safety bonuses aggregating $125,060 were awarded last week by the Brooklyn City Railroad and the Brooklyn-Manhattan Transit, Brooklyn, N. Y., to their employees who had a record for no "at fault" accidents in operating surface cars. The former distributed $71,000 and the latter $54,060.

On behalf of the Brooklyn City Railroad, Borough President Byrne, in his reception room at Borough Hall, on Dec. 16 presented to each of 28 motormen, conductors and safety car operators of the company a gold watch suitably engraved. The company awarded the watches to those employees who had operated cars for the twelve months ended Nov. 30, 1927, without an accident. The watches were presented in addition to the regular $60 safety bonuses which each man earned.

Mr. Byrne, after commending the men for their work in reducing accidents on city streets, handed to each employee a watch on which was engraved "Presented to ——— by Borough President James J. Byrne for Brooklyn City Railroad, Dec. 16, 1927, in appreciation of an excellent safety record Dec. 1, 1926, to Nov. 30, 1927." Those who received the watches were:

John Boyce, Vincenzo Cincotta, Lawrence G. Day, John Dinnean, William Esperstedt, Christian Frohlich, T. J. Fallon, Michael Hamil, W. J. Hammill, C. F. Heynen, J. Juggenheimer, M. J. Kowalinski, Patrick Keane, Patrick Kilday, Michael J. Killeen, Patrick McGuiness, James J. Martin, James J. O'Keefe, Stanislaw Olszewski, Frank Reahl, Mathew J. Reilly, John Rothenhousen, Jacob H. Schultz, Anton Schock, Henry W. Schult, Frank M. Smith, Adolph Seebeck, Frank J. Weiss.

The award of safety bonus checks is an annual feature of the Brooklyn City Railroad's campaign to reduce accidents on its transit lines. All motormen, conductors and safety car operators are credited with $5 for each 30 days operation without accident during the period from Dec. 1 to the following Nov. 30.

Clinton E. Morgan, vice-president and general manager of the railroad, states that of the 2,180 car operators of the company 91 per cent received checks this year in amounts varying from $60 to $5. The total amount of the bonus, for 1927, $71,000, was earned by the men in reducing all accidents for the year ended Nov. 30, 1927, over the preceding twelve months by 12 per cent. The 1,987 men who received awards this year worked 428,820 days without an "at fault" accident. Officials of the company computed that the 28 car operators who received the gold watches had carried 7,819,000 passengers and operated their cars more than 752,000 car-miles without an accident.

Bonuses aggregating $54,060 on Dec. 16 were in the hands of 1,892 motormen and conductors of the B.-M. T. surface lines as a reward for operating their cars for one or more periods of 30 days without accidents for which they were at fault.

The bonuses were awarded as a result of the accident prevention bonus plan put into effect on the B.-M. T. surface lines on Feb. 1, 1927, and were earned during the ten months ended Dec. 1, 1927. The individual bonuses ranged from $55 to $5 and averaged nearly $30 to each of the 1,892 car men who qualified for bonuses under the plan.

Photo by Underwood & Underwood

Brooklyn surface trainmen receiving awards for safety, with Borough President Byrne officiating

Of the $54,060 total, $2,425 was distributed as special bonuses to 485 motormen and conductors who in the period from Feb. 1 to Dec. 1 had operated their cars for at least 180 consecutive working days without an accident for which they could be held responsible. The records showed that 130 motormen and conductors had maintained absolutely clear records so far as chargeable accidents were concerned during the entire ten-month period.

Efforts—and success—in reducing accidents were not confined to the veteran car men, however. This fact is established from the records, which show that 1,892 out of a total 2,131 men at the various B.-M. T. depots operated for one or more periods of 30 consecutive working days without an "at fault" accident. These 1,892 men together operated their cars for 310,000 working days without being responsible for a single accident.

Rehearing on Oakland Fare Request

A rehearing has been granted the Key System Transit Company of Oakland by the California Railroad Commission on the 5-cent zone fare order which was halted by the company's protest. Commissioner Clyde Seavey will preside at the rehearing, set for Jan. 24 in the City Hall at Oakland.

The company seeks to have its own plan substituted for the zone plan. It has asked a raise in transient street car fares from 7 to 10 cents and in ferry fares from 21 to 25 cents. The company also seeks permission to sell weekly passes to regular riders for $1 over territory now included in the 7-cent fare zone and for $1.50 weekly over entire traction system. Monthly passes good on Key System cars, trains and boats would cost $10.

The commission's order for a 5-cent zone or basic fare and 20 cents on ferries was attacked as confiscatary in the company's formal protest.

No Parking Law Effective in Chicago Loop Jan. 2

Parking of automobiles in the Chicago Loop district will be abolished for a trial period of three months beginning Jan. 2 under the terms of an ordinance passed by the City Council on Dec. 14 by a vote of 37 to 4. It is expected it will be signed by Mayor Thompson. Prohibition against parking has been urged by civic bodies and traffic experts for many months as the only effective means of expediting street traffic in one of the most heavily congested districts of its size in the world. The ordinance, which has been approved by the Chicago Association of Commerce, embodies many of the recommendations made by Miller Clintock of Harvard University, in the traffic survey he completed last year.

The new rule will be in effect from 7 a.m. to 6:30 p.m. except Saturdays, Sundays and holidays. On Saturdays it will be enforced only until 3 p.m. All restrictions will be lifted on Sundays and on certain national holidays. This ban will not affect stops made by vehicles to discharge or pick up passengers. Taxicab stands established by ordinance will also be entitled to their quota of cars awaiting fares. Ambulances, fire trucks and public utility company vehicles operated for emergency purposes will likewise be exempted from the ban. Penalties for violation of the ordinance are fixed at from $1 to $25 for each offense. If, after a few months' time, the restriction should be popularly regarded as a failure, the City Council indicated that the law would be repealed.

Among the objections cited to the ban—many of which were heard in previous public meetings on the question—was that it would bring more taxicabs on the street and discriminate in favor of the automobile owner employing his own chauffeur. Several downtown merchants and hotel proprietors testified at the hearings that it would drive away business from their doors. Proponents of the law held that it would speed up traffic and help business by making the downtown streets more passable for shoppers.

Utility Inquiry Authorized

Senator Walsh (Democrat) of Montana, on Dec. 17 introduced a resolution proposing an inquiry into the financing and control of public utilities companies throughout the country and into any attempts which may have been made by the companies to carry on propaganda to influence public opinion with respect to the ownership of sources of power, or the generation or distribution of power.

The investigation proposed, under the terms of the Walsh resolution, would be carried on by a special committee of five Senators.

Senator Walsh asked that his resolution be referred to the committee to audit and control contingent expense. Senator Moses (Rep.) of New Hampshire asked first if Senator Walsh would be satisfied to have the resolution referred to the committee on interstate commerce and when the latter said he saw no reason for such a reference, Senator Moses then asked that the resolution lie over for future consideration.

On Dec. 19 the Senate by a vote of 40 to 36, decided to refer the Walsh resolution to the committee on interstate commerce. On the vote to send the resolution to the latter committee thirteen Democrats joined with 27 Republicans in opposition to the course of action sought by the Montana Senator. On the other side eleven Republicans voted with 24 Democrats and Senator Shipstead (Farmer-Labor), Minnesota, in opposition to the motion of Senator Moses.

The resolution differs from the one introduced by Senator Walsh in the last Congress, in that several new clauses have been added, the most important being that embodied in the second paragraph concerning publicity and political activities of utility companies, which is entirely new.

Consideration of the matter by the committee will begin on Jan. 16.

Harvard Advertising Awards to Be Announced in January

The jury of the Harvard Advertising Awards, including prominent advertising men of agencies, publications, industry and educational institutions, will meet the middle of January to award the prizes for outstanding advertising material of the year, 1927.

These awards are:

1. Four prizes of $2,000 each for the campaigns most conspicuous for the excellence of planning and execution, seeking publicity on a national scale, seeking publicity for industrial products primarily through trade journals, seeking publicity in a local area, and for the campaign executed locally in cities of 100,000 population or less.

2. Four prizes of $1,000 each for the advertisement most effective in its use of text, for the advertisement most effective in its use of pictorial illustration, for the advertisement most effective in its combination of text and illustration, and for the advertisement most effective in typography.

3. A prize of $2,000 for the advertising research of the year most conspicuous either because it has brought about economy or secured efficiency in advertising by producing information of general value in furthering the science of advertising, or because it has reduced or precluded unwise or wasteful expenditure in a specific advertising program.

4. A gold medal, awarded to the individual or organization deemed by the jury to merit recognition for distinguished contemporary services to advertising.

Advertising material to be eligible for this year's competition must be submitted to the Harvard Advertising Awards, Harvard Business School, Soldiers Field Station, Boston, Mass., not later than Dec. 31, 1927.

The Harvard Advertising Awards, were founded in 1923 by Edward W. Bok.

Outline of Public Utility Economics

By Martin G. Glaeser. New York: Macmillan Company, 1927. 847 pages. Price, $4.25.

This is one of the series of social science text books edited by Dr. Richard T. Ely, who has written an introduction to the book. He believes that future writers will refer to the volume as beginning the scientific treatment of public utilities.

The author is professor of economics at the University of Wisconsin and Research Associate of the Institute for Research in Land Economics and Public Utilities. He also brings to his task the benefit of long experience as statistician and case investigator for the Wisconsin Railroad Commission. The book is divided into four parts, as follows: The economic basis of public utility enterprises, the development of agencies of regulation in the United States, the administration of public utilities under regulation, and trends in public policies affecting utilities. Throughout the book are many statistical charts and tables, which help to illuminate the text. In his discussion of valuation of utilities, the author tends toward the investment method, and recommends a variation in the rate of return according to current interest rates. The appendix includes a proposed service-at-cost franchise, drafted for Milwaukee by a joint aldermanic and citizens' committee for which Professor Glaeser acted as adviser.

The volume should be most helpful to electric railways, the problems of which are considered extensively in "The Outline of Public Utility Economics."

Recent Bus Developments

Competition Between Kansas City and Independence Denied

The Missouri Public Service Commission decided on Dec. 16 that the privilege of a bus company to compete with the suburban street car lines of the Kansas City Public Service Company between Kansas City and Independence, Mo., should be denied. An application for a bus permit submitted by King Brothers to operate buses between Oak Grove and Kansas City was granted by the commission with the proviso that the company should refrain from picking up or discharging passengers between Independence and Kansas City on the grounds that the street railway company was already giving "excellent and frequent service" in that territory. The bus company will be permitted to receive and discharge fares between Oak Grove and Independence and carry such passengers to Kansas City. The buses will use United States Highway No. 40.

Consents for Newark-Paterson Buses Approved

Municipal consents to the Public Service Transportation Company, Newark, N. J., to operate eight de luxe auto buses on the Paterson-Newark route, by way of Bloomfield and Clifton, have been approved by the Public Utilities Commission. The testimony indicated the proposed route would afford a quicker service between Paterson and Newark. The rate of fare follows: Newark to Bloomfield, 25 cents; Newark to Clifton, 40; Newark to Paterson, 50 cents.

Program for Interstate Carriers Urged

The lack of federal legislation for control of bus operations in interstate traffic creates a problem of increasing importance with the expansion of the traffic, says the Interstate Commerce Commission in its annual report to Congress, recently issued. The full text of the statement made by the commission on this matter reads:

In our last report we referred to the investigation on our own motion into and concerning the general question of the operation of buses and trucks by, or in connection or competition with, common carriers subject to the interstate commerce act.

During the past year laws were enacted in four states providing for the regulation or control over common-carrier motor vehicles in 42 states and the District of Columbia. The rapidly increasing use of buses and trucks makes the absence of any regulatory control over those engaged in interstate commerce a problem of constantly increasing importance.

Statistical summaries of the answers of the respondent railways to questionnaires have been tabulated and made available to the public.

We deem it advisable that a proposed report be prepared by an examiner and served upon the parties to the proceedings, thus affording opportunity for the filing of exceptions thereto, to be followed by oral argument before us and report thereon to the Congress with our recommendations as speedily as may be consistent with the nature and importance of the subject.

Buses Must Remain Off Car Streets in Peru

An amendment to the bus law in Peru, Ind., recently passed by the City Council states that it will be unlawful for public service automobiles to operate on streets paralleled by street cars except where it is necessary for the drivers to make up their routes. The ordinance fixes a bond of $2,000 for each operator—or machine—having a carrying capacity of not more than five persons, and an additional sum of $250 for each person in excess of that number. The maximum bond for any bus will be $3,000 annually. All operators must make written application for licenses. The Indiana Service Corporation operates in Peru.

Dismisses Objections of Schuylkill Railway

The Superior Court dismissed the appeal of the Schuylkill Railway, Girardville, Pa., on Dec. 15 from the order of the Public Service Commission granting a certificate of public convenience to the Reading Transportation Company, which is to operate the bus lines in twenty-four counties of Pennsylvania. The Schuylkill Railway interests based their opposition on the fear of destructive competition. Judge Henderson said in an opinion that the objections "are premature, as nothing has yet been decided by the Public Service Commission save that on the evidence submitted the new corporation may be created."

Extensions in Connecticut

Bus service has been started by the Connecticut Company between Meriden and Middletown, Conn. The company still maintains service on its electric railway between Westfield and Meriden.

New Service by Bus in Gadsden

The Alabama Power Company, owner and operator of the electric railway at Gadsden, Ala., will take up the car tracks on Ewing Avenue, Gadsden, and substitute bus service. The power company is to pay $5,000 toward the cost of paving this thoroughfare.

Buses in Joplin Follow Cars

The Joplin & Pittsburg Railway has organized a bus line to supplant the cars on the Cunningham-Schifferdecker Park division in Joplin. For most of the way the buses follow the route of the railway.

New Line in Kansas City Promised

After more than two years of attempting to secure adequate transportation facilities for the vicinity of 43d Street, Kansas City, Mo., the residents of the neighborhood have at last secured the approval of the Kansas City Public Service Company and a bus line with ten-minute service for an eight-hour day will be installed. The Indiana Avenue stub line did not afford adequate transportation. Transfers will be given from buses to cars. The City Council has yet to pass upon the installation.

Larger Bus Proposed in Boston

The Boston Elevated Railway has decided to introduce into the service in Boston, Mass., a motor coach of a larger type than that now in use and is planning a 60-day experiment with two buses that resemble a modern trolley car, are 31 ft. long and seat 40 passengers. Longer cars are not permitted in Boston under the bus laws and the rules of the Public Utilities Department, but the Elevated is seeking a special 60-day exemption from those rules in the case of two trial cars. If the opportunity for an experiment is given the route used will be in a busy business section, and if it proves successful the company will buy larger buses in the future. No opposition to the plan has been encountered, but it may be necessary to secure an amendment of the bus laws of the state.

Buck vs. Kuykendall Quoted in Another Interstate Case

The Appellate Division of the New York Supreme Court for the Second Department has handed down a decision sustaining the right of the Journal Square Coach Transportation Company to operate a bus line between Journal Square, Jersey City, and the town of Nyack, in New York, without a license from the Town Board of Orangetown. It also reversed the order made by Justice Arthur S. Tompkins on Aug. 20, 1927, restraining the Journal Square Coach Transportation Company from continuing to operate a bus line over the public highways in the town of Orangetown until granted permission to do so by the Town Board of Orangetown.

The decision of the Appellate Division upholds the contention made in behalf of the Journal Square Coach Transportation Company that, since it was engaged only in interstate transportation, it was not required by law to secure

Digitized by Google

the consent of the Town Board of Orangetown for such interstate operation. This was in effect also the prior ruling made by the Public Service Commission. It overrules the contrary views advanced by the Town Board's attorney, E. W. Hofstatter, which the Town Board had followed in stopping the operation of the bus line.

The decision of the Appellate Division was unanimous.

By its decision, the Appellate Division reversed the temporary injunction order of Justice Tompkins and denied the original motion of the town of Orangetown for a temporary injunction. It held that the Journal Square Coach Transportation Company was not required to have either a license from the local authorities or a certificate of convenience and necessity from the Public Service Commission, but that the bus company was subject to impartial reasonable regulations by duly constituted authority. It also held that the action of the town of Orangetown in denying the company's application was arbitrary.

The opinion of the court, in full, is as follows:

364 N.E. Town of Orangetown, respondent vs. Journal Square Coach Transportation Cmpany, appellant.

Order reversed upon the law, with $10 costs and disbursements, and motion for injunction pendente lite denied, the $10 costs. The plaintiff arbitrarily denied the application of defendant for a license. No question of rules, regulations or tax free requirements were raised. The defendant, which is doing an exclusively interstate transportation business, is not required to have either license from local authorities or certificate of "convenience and necessity" from the Public Service Commission, and may operate subject to reasonable rules and regulations adopted, and payment of reasonable fees provided for, by duly constituted authority. (Buck vs. Kuykendall, 267 U.S. 307; Bush Co. vs. Maloy, 267 U.S. 317.) Rich, Young, Kapper, Lazansky, and Hagarty, JJ. concur.

Bus Substitution Suggested in Moorestown

The Public Service Railway, Newark, N. J., desires to abandon railway service from Camden to Moorestown and substitute buses. Before the Board of Public Utility Commissioners in Camden on Dec. 5 a railway representative said that if trolley service were continued it would be necessary to spend $200,000 for new tracks, that it was the purpose of the company to operate buses on a fifteen-minute headway along with service to Mount Holly by way of Burlington. At the suggestion of counsel for the community of Moorestown the case was continued so as to permit public sentiment to be sounded.

PERMIT GIVEN FOR BUS OPERATION.—The Wisconsin Motor Bus Lines has been granted a permit by the West Allis City Council to operate buses from Milwaukee to West Allis. This is the bus subsidiary of the Milwaukee Electric Railway & Light Company.

Financial *and* Corporate

United Gas Improvement Sells Stock of National Public Service

The United Gas Improvement Company has arranged to sell its minority interest in National Public Service Company B stock to E. H. Rollins & Sons and Howe, Snow & Company of New York.

These firms previously held about 15 per cent of the common B stock, no par value, which has exclusive voting power.

The sale of the B stock embraces 50,000 shares owned by the United Gas Improvement Company direct and 48,946 shares owned by Day & Zimmermann, Inc. The United Gas acquired its B stock when it purchased control of Day & Zimmermann, Inc.

The National Public Service Company is a holding company, which, through its subsidiaries in New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, Georgia and Florida, operates steam, electric railways and buses to 374 communities with a population of more than 2,000,000.

Suburban Line Merged With Milwaukee System

The Wisconsin Railroad Commission has approved the merger of the Milwaukee Northern Railway with the Milwaukee Electric Railway & Light Company. The Milwaukee Northern operates between Milwaukee and Sheboygan. City fares on the Northern line will be increased from 5 cents to 7 cents to conform with Milwaukee city fares. The Milwaukee Electric Railway & Light Company has long held the second preferred and the common stocks of the Milwaukee Northern Railway.

Last of Mesaba Railway Soon to Be Sold

With practically all of the company property and equipment sold, receivers for the defunct Mesaba Railway, Virginia, Minn., serving Mesaba Range communities, expects an early discharge of the receivership.

When the remaining property and the other equipment are disposed of, it is estimated that the gross salvage return on a total cash investment of about $2,000,000 will amount to about $200,000. From this sum receivership expenses and other debts must be met.

Considerable office equipment, several car bodies, the former residence of the superintendent of the line, and twenty-six lots in the Great Northern addition to Virginia, remain to be disposed of, as well as a substation and waiting room at Chisholm.

In all, nine car bodies have been purchased by buyers, for a varied number of uses.

The company passed into the hands of the receivers, James C. Chestnut, Virginia, and Oscar Mitchell, Duluth, on March 7, 1924. Authority to abondon the line was granted by Judge Cant late last winter. The last passenger car was operated over the line from Hibbing to Gilbert on April 16 of this year, but freight car service was continued until June.

The interurban line was placed in service on Christmas day, 1912. The system comprised 40 miles of line.

Reorganization of Indianapolis & Cincinnati Traction Awaited

Intimation was made recently in Circuit Court at Rushville, Ind., that plans were afoot to perfect a reorganization of the Indianapolis & Cincinnati Traction company, as the time draws near for the official court order to sell the property involved in a mortgage that exceeds $2,000,000. The receivership case has been pending in court for several months, and has almost reached the point where the court is ready to order the receiver, Will M. Frazee, to sell the properties.

Receivers Discharged in Oklahoma City

The receivership of the Oklahoma Railway, Oklahoma City, Okla., under which the road has been operated since Dec. 28, 1924, was ended on Dec. 16 when George A. Henshaw, and G. T. Lackey, joint receivers turned the properties to Hubert R. Hudson and his associates, who recently acquired the controlling stock in the road.

Coincident with the announcement of the ending of the receivership, President Hudson declared that rearrangement of the financial structure of the road was under way.

Messrs. Henshaw and Lackey will continue in charge of the road until Jan. 1, at which time Mr. Henshaw will again devote all his time to his private law practice. Mr. Lackey plans now to remain with the company indefinitely, in order to assist with the reorganization. He has been with the railway since 1920, in an executive capacity.

When bondholders finally asked for a receivership late in 1924, the railway was at a low ebb, having seen a steady decline since 1921, as motor cars continued to increase in numbers. Mr. Henshaw, a former corporation commissioner and widely known attorney, was named by Judge Cotteral to be a joint receiver with John W. Shartel, then president of the company. Mr. Lackey succeeded Mr. Shartel, at Mr. Shartel's death eighteen months ago.

Digitized by Google

Since the receivership, however, the fortunes of the railway company have moved in a different direction. Increasing motor cars have made traffic congestion so terrific that street cars are hauling more people every month. Revenues for the first eleven months of 1927 were $1,913,645, compared with $1,570,967 during the similar period a year ago. For the first ten months of 1927 13,123,855 fares were collected. For the similar period last year the number was 11,796,215. The total for 1926 was 14,360,274. On the strength of the comparison for the first ten months of both years Charles Hoopes, operating manager, predicts that the total for 1927 will be approximately 16,000,000 fares.

Ten years ago the railway carried 14,301,323 passengers. By 1920, the peak year in the history of the company, the cars were carrying 20,532,897 passengers. In 1922, this figure was cut to 17,650,854. Then the slump continued in an alarming way until last year, which showed improvement over year before.

During the receivership the number of new type cars has been increased from ten to forty, while in all the company has in operation 126 street cars and 26 buses. Tracks are in excellent shape, it being pointed out that nearly $200,000 has been spent during the last year for repairs.

Intention of Appeal Filed by O'Fallon

Notice of intention to appeal to the United States Supreme Court was given by the St. Louis & O'Fallon Railroad on Dec. 19 when a special three-Judge Federal Court entered its formal order upholding the Interstate Commerce Commission's order for recapture of approximately $260,000 excess earnings of the railroad.

Decision in the O'Fallon case was announced Dec. 10. The suit has been regarded as the key case to the valuation of all railroads of the United States for ratemaking and the limitation of earnings.

Approval of $2,475,000 Note Issue Sought in St. Louis

Right to issue $2,475,000 of 5 per cent gold notes is sought by the St. Louis Public Service Company in an application filed with the State Public Service Commission. The application states that this is a part of the plan to facilitate the funding of the $36,300,000 of first mortgage bonds of the United Railways assumed by the successor company.

The first $9,000,000 of the United Railways will mature in 1934. The St. Louis Public Service Company proposes to give for each $1,000 bond $600 in cash, with interest at 6 per cent from Jan. 1, 1928, to date fixed for payment and $275 in gold notes.

The gold notes may be called for redemption in 30 days at the option of the company or converted at option of the holder into preferred stock of the St. Louis Public Service Company at the rate of three shares of the series "A" of the preferred cumulative dividend stock.

Tax Settlement Nets Saving for Akron Company

Suits brought by the Northern Ohio Power & Light Company, Akron, Ohio, in the federal court at Cleveland enjoining the collection of the 1925-26 utility taxes in Summit and other counties of Ohio have been settled. Under the settlement the company saves about $125,000 on its Summit County taxes for the two-year period involved.

In its suits the Northern Ohio Power & Light Company contended that its property was listed for taxation at practically its full value, while other property was listed on a basis of 40 to 50 per cent. The company made it plain that it had no desire to evade its taxes, but contended that the valuation of its property should be reduced or the valuation of other property be raised.

Some counties settled with the company immediately, but others served notice they would contest. The move just made ends the controversy. On a showing recently made before the State Tax Commission that assessments against the company were excessive and unfair compared with other assessments throughout the state the board reduced the tax valuation for future assessments nearly $4,000,000.

Would Foreclose on South Bend Property

The Harris Trust & Savings Bank of Chicago has filed suit in the United States District Court at Grand Rapids to foreclose on $536,000 of bonds of the Southern Michigan Railway, controlled by the Chicago, South Bend & Northern Indiana Railway. The bank asks for an accounting of all property and interest on bonds, the appointment of a receiver and an injunction enjoining officers of the interurban company from disposing of any property.

Borrowing from Peter to Pay Paul in Seattle

For the first time since the Seattle Municipal Railway, Seattle, Wash., began paying on the principal of its $15,000,000 bonded purchase debt eight years ago, it will not be put on a warrant basis to enable it to meet an installation due next March. Not that Seattle has the money ready, but simply that city officials plan to borrow from the Light and Water Departments since $4,000,000 of Light Department bonds were sold recently and not all of the money acquired through these bonds will be required by the Light Department for some time.

Last year loans totaling $600,000 were negotiated to tide the railway over after the banks of the Seattle Clearing House Association declined to cash the warrants issued to meet salary checks for the Dec. 24 payroll. The warrants carry 6 per cent interest, which interest, it is ingeniously explained, would be

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

†This index is changed to a base of "1926 = 100." That notation replaces the former basis of "1913 = 100." Inasmuch as the bureau has not calculated the index on this new base any further back than January, 1923, no figures are shown in this tabulation for the high and low points since the war. It is planned to compute the index on the new basis as far back as January, 1913. Until such time as the bureau makes public these figures for the earlier years this information will be lacking.

paid by the railway on any sum it might borrow from the light department to tide the railway over.

Cars and Trestle on Deferred Payment Plan in Seattle

Seven members of the City Council of Seattle, Wash., and Mayor Bertha K. Landes have informally agreed to have C. W. McNear & Company, Chicago, purchase fifty new cars for the Seattle Municipal Railway and build a $715,000 trestle over the West Duwamish Waterway and lease both the cars and the trestle to the city of Seattle.

As a result of the agreement, a resolution stating that it is the intention of the Council to enter into an arrangement of this kind will be introduced at a special meeting of the Council shortly. Meanwhile Corporation Counsel T. J. L. Kennedy will be asked to pass upon the legality of the proposed contract.

The Pacific Car & Foundry Company, Seattle, is to be awarded the order for the cars while the trestle contract is to be let to a Seattle concern, if possible. McNear & Company proposes to lease the cars to the city for fifteen years under an arrangement by which the city will pay $50,000 a year during the first four years, and $120,000 a year during the next eleven years. At the expiration of the lease the cars would become the property of the city. An annual toll charge would be paid by the city during the twenty years of the lease of the trestle, the city taking over that structure at the end of that period.

Mayor Landes points out that this form of contract would probably cost the city more than if the cars and trestle were obtained by a straight bond issue, but with the present litigation in which the railway is involved, it has been found impossible to market railway bonds to provide the money needed for the cars and trestle.

Rochester Goes Slightly Behind

Street railway commissioner's report for year ended July 31 shows 3,781,385 fewer passengers with company $60,128 behind allowed return. Fares increased to 9 cents recently

CHARLES R. BARNES, city railways commissioner of Rochester, N. Y., has filed his report covering bus and trolley operations of the New York State Railways under the service-at-cost contract for the year ended July 31. His summary of operations shows 3,781,385 fewer passengers carried than during the previous year. The total number for the year ended July 31, 1926, is 91,717,817, while the total for the twelve months ended July 31, 1927, was 87,936,432.

The company failed by $60,128 to earn its guaranteed return last year. The accumulated deficit is $341,782.

In his report, Mr. Barnes commented on the increasing use of automobiles as hurting the company's revenues and branded as unfair the system whereby the railways must bear the cost of paving, which, he believes, should be levied on all taxpayers. He blames this situation for the recent increase in Rochester fares from 8 to 9 cents and deems it unfair that the street car riders must bear the burden.

In commenting on this condition, James F. Hamilton, president of the New York State Railways, said to a Rochester representative of the ELECTRIC RAILWAY JOURNAL:

> Something must be done if street car companies are to conduct their business successfully. This cannot be accomplished unless the fare is kept low to encourage mass riding. Each year fewer riders are carried. The car rider must be protected from unjust distribution of paving costs.

Commissioner Barnes said that the profitable operation of buses depended on greater general use by the public. In this connection he said that the fact that riders on the trackless trolleys and on the buses are steadily increasing in number in the face of the decrease in trolley riders, which has been continuous throughout the life of the contract, is regarded as demonstrating a real necessity for this supplementary service. Mr. Barnes said in part:

> To care for the travel 9,544,212 car miles were run with mileage for trackless trolleys totaling 230,790, and with bus mileage of 408,207. Generally speaking, the trolley mileage has been maintained up to the standard established in prior years. The mileage run by trackless trolleys and buses was increased substantially, the increase for trackless trolleys having been 10,567 miles, or approximately 5 per cent, while the mileage on the bus line was increased during the year almost 70 per cent, due principally to additional routes. The mileage of the operating system at the close of the year ending July 31, 1927, was as follows:
>
> Trolley car trackage 169.14
> Trackless trolley routes 2.75
> Gasoline bus routes 58.35
>
> The result of operation for the year showed for railway lines a profit of $1,611.51, but a deficit from supplementary service totaling $61,740 left an aggregate deficit for the year of $60,128, and an accumulated deficit at the end of the year of $341,462.
>
> Among the outstanding items which have been increasingly manifest during the past year the following may be mentioned:
>
> (a) Material improvement has been made in the condition and appearance of the rolling stock, and especially during the past year, to such an extent that at present the equipment meets, all of the requirements of safety, comfort and convenience of passengers.
>
> (b) Substantial improvement has taken place in connection with the equipment and program for car heating, an item which is very necessary in connection with the health and well being of the car riders.
>
> (c) The car lighting has been definitely improved and sufficiently to warrant the assertion that the street cars in Rochester are now really illuminated.
>
> (d) Extensive reconstruction work was done during the year, including Main Street West, Main Street East, Plymouth Avenue and Lyell Avenue. In addition a large amount of money was expended in track and pavement maintenance throughout the system generally.
>
> (e) As mentioned previously herein, the

REPORT OF ROCHESTER RAILWAY FOR YEAR ENDED JULY 31

	Railways	Bus Lines	Combined
Revenues from Transportation:			
Passenger revenues	$5,161,261	$118,875	$5,280,136
Chartered car revenues	3,000	.....	3,000
Bus rentals	.....	1,855	1,855
Mail revenues	87	.....	87
Miscellaneous transportation revenues	1,745	132	1,878
Total revenue from transportation	$5,166,095	$120,862	$5,286,958
Revenues from Other Railway Operations:			
Station and car privileges	$60,685	.....	$60,685
Rent from tracks and facilities	35,002	.....	35,002
Rent from buildings and other property	22,234	.....	22,234
Miscellaneous operating revenues	.....	1,271	1,271
Total revenue from other railway operations	$117,921	$1,271	$119,193
Total operating revenues	$5,284,017	$122,134	$406,151
Operating Expenses:			
Maintenance of ways and structures	$478,086	.....	$478,086
Maintenance of equipment	398,389	.....	398,389
Power expenses	289,067	.....	289,067
Conducting transportation	1,667,279	.....	1,667,279
Traffic expenses	10,370	.....	10,370
General and miscellaneous expenses	552,803	.....	552,803

Service-at-cost operating surplus or deficit	$1,611	$61,740	$60,128

Digitized by Google

mileage made by trackless trolleys and gasoline buses has been materially increased.

(f) During the year there were no material changes in car routeing. Some minor changes were made in car stops.

(g) During the year there were no extended interruptions to service resulting from failure of power supply.

No change in the rate of fare charged was made in the year ended July 31, 1927, although in accordance with the terms of the contract, an increase in fare was warranted. Subsequently and since the close of the year, the company served notice of a fare increase which became effective as of Dec. 1, 1927. Even with this later increase, the cash rate of fare charged in Rochester remains lower than it does in any other large city in the State, except New York City, and also remains lower than in practically all other large cities throughout the country. That in its fare increase Rochester has been consistently behind the rest of the cities was due to two things: First, the economical operation which has been possible under the terms of the contract, and secondly, the reluctance of the company to insist upon an enforcement of the terms of the contract while there was any hope that conditions would change in such a way as to make an increase unnecessary.

The increase in the rate of cash fare from 8 cents to 9 cents took effect after the close of the fiscal year but because of that increase in rate, it is deemed pertinent and advisable to refer to what was set forth in the previous annual report on this important factor in the raise of fare, viz.: The unjust charge borne by the street car riders for paving the streets of the city, which pavement they do not use. While the former report dealt in detail with this subject, general discussion of it has been so extensive that it is believed the public generally are convinced of its injustice, and it is hoped that corrective measures will be taken in the near future to relieve the car rider of this burden. The recent increase in rate of fare brings the subject directly home to the car riders, as, were it not for the amount of money spent for the purpose of paving, the deficit which caused the increase in fare would not exist. This burden on the car riders is not a condition confined to operation under the service-at-cost contract. In some cities the law has been modified relieving transportation systems of paving costs, but in all other cities these paving expenses affect the rate of fare paid by the car riders.

In the report for the year ended July 31, 1926, considerable space was devoted to the underlying need for additional transportation facilities, and to the considerations which have been developed to increase the service by means of trackless trolleys and gasoline buses. It was then said that under circumstances such as were in force in Rochester, supplementary service of the character required only infrequently paid their full way from the start. That there was a need for service of this kind has been amply demonstrated by the results of operation for the past. During this time the volume of such travel steadily increased, that on the gasoline buses being double what it had been during the first year of gasoline bus operation, while the trackless trolley volume increased more than 10 per cent.

This business has not as yet reached a point where it is paying its way in full, but having in mind the substantial benefits which this growth of service has conferred upon the city at large, by way of increased availability and flexibility of service, it has justified itself.

Personal Items

D. Boal Succeeds E. J. McIlraith in Chicago

Daniel Boal, formerly assistant superintendent of schedules and time-tables of the Chicago Surface Lines, Chicago, Ill., was appointed superintendent of the department on Dec. 1 to succeed E. J. McIlraith, acting superintendent. Mr. McIlraith continues as staff engineer of the company.

The new superintendent entered the service of the Chicago City Railway (the south side lines) in 1902, as a window washer, and was later transfer clerk, working nights. At the same time he was attending the University of Illinois medical school, from which

Daniel Boal

institution he was graduated in 1906. In 1909 Mr. Boal went to Seattle, Wash., where he entered the mechanical department of the Seattle railway system, then known as the Seattle Division of the Puget Sound Traction, Light & Power Company. The following year he accepted a position in the schedule department of the company, where he remained until 1919. In that year he went to the Philadelphia Rapid Transit Company, and remained with that company for one year. Returning to Seattle in 1920 Mr. Boal remained there until May, 1923, when he entered the schedule department of the Chicago Surface Lines as assistant to Mr. McIlraith.

Personnel Changes in Minneapolis Suburban Line

At a special meeting on Dec. 5 H. E. Pence was elected president of the Minnesota Western Railroad and the Electric Short Line Terminal Company. He is president of the Minneapolis, Northfield & Southern, which recently acquired control of the two other companies. W. R. Stephens was made vice-president of the two lines, E. C. Bahr secretary-treasurer of the Minnesota Western and F. C. Malcolmson of the Electric Short Line Terminal Company. The terminal is used by the Anoka and the Cuyuna Range trolley line trains as well as the gaso-electric passenger trains of the Southern and the Western lines, which are three suburban railways operating north, south and west.

A Railway Specialist Inspires News Writer

Col. William C. Lancaster, grade crossing protectionist and electric railway specialist, was made the subject of a personal sketch in the Brooklyn *Eagle* for Nov. 13. Colonel Lancaster has done many big things in tunnel construction work, ship enterprises and power development, but electric railways are his hobby.

At the present time he is with the New York Transit Commission applying his knowledge of electrical and civil engineering in the post of chief engineer. He has charge not only of all the engineering work in connection with the regulation of New York City's rapid transit and surface lines but also of the grade crossing elimination program for the five boroughs of the city. He is chairman of a committee designated to investigate the practicability of a lighter steel car to operate on New York City's elevated structures where wooden cars now operate, because the structures are not strong enough to carry steel cars of the present design.

Among his other accomplishments Colonel Lancaster helped to work out plans for equipping many of the rapid transit lines in New York City with automatic block signals and designed a system of gauntlet tracks on the lines running into Queens. From Havana to Canada Mr. Lancaster is known for his constructive genius and initiative in carrying through some important construction projects.

L. C. SINGLETON is the new superintendent for the Eastern Texas Electric Company, Beaumont, Tex. He succeeds Charles A. Brann. Mr. Singleton has been with the Eastern Texas Electric Company in Beaumont since 1919 in the capacity of claim agent and safety director. He plans to carry out the work of improvement started by his predecessors.

DWIGHT FOUST, a former dispatcher of the Northern Ohio Power & Light Company, Akron, Ohio, has been chosen instructor of the permanent training course for the electric railway operators of that railway. He will have charge in Akron, Canton and Massillon. Mr. Foust is a graduate of Wittenberg College. He began train service in Canton. Later he was transferred to Akron, being promoted from trainman to dis-

Digitized by Google

patcher for his outstanding efficiency. Mr. Foust has been dispatcher in the Kenmore yards for several years.

FRED E. SWAIM, a public accountant of Huntington, Ind., has been appointed assistant in the accounting division of the Indiana Public Service Commission. Mr. Swaim succeeds R. L. Gwinn, recently resigned.

F. W. ALLARD, formerly first aid instructor of the roadway department of the Georgia Power Company, Atlanta, Ga., has been appointed director of all safety work in the roadway department. Mr. Allard succeeds W. J. Adams, resigned.

FRANK T. SINGLETON, chairman of the Indiana Public Service Commission, has been selected as one of the directors-at-large of the National Safety Council, it has been learned in Indianapolis. Mr. Singleton's term is for three years. Since he was chosen as safety member of the Indiana commission in 1924 he has taken an active interest in safety measures, particularly those pertaining to public utilities.

ROBERT L. BEYERLE has been selected general foreman of the Silver Lake Junction shops of the Northern Ohio Power & Light Company, Akron, Ohio, in place of Fred J. Sarbach, who died recently. Mr. Beyerle has been with the company since 1910 with the exception of one year, in which he was in the aviation corps as a mechanic. He was born in Ohio. His predecessor was foreman of the Silver Lake shops for several years.

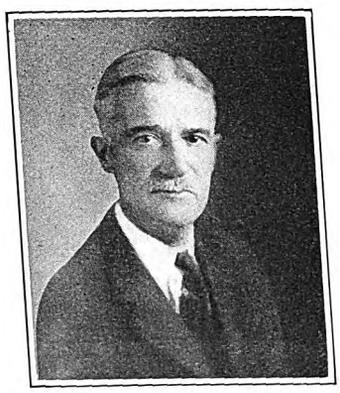
HUGH DOAK has been appointed assistant director of the Tennessee Public Utility Information Bureau, according to announcement by Guy P. Newbern, director. Editor of the Manchester *Times* and State vice-president of the National Editorial Association, Mr. Doak is a newspaper man with more than twenty years experience, having started his newspaper career on the *Cannon Courier*, Woodbury, Tenn., in 1905. He worked on various other Tennessee newspapers and for a time was in the commercial printing business in Nashville. In 1913 he purchased the Manchester *Times* and has operated that newspaper since. Mr. Doak will retain his newspaper interest as owner and editor of the Manchester *Times*, in addition to his new duties.

W. H. SWINNEY of New York City is now serving as comptroller of the West Penn Electric Company and subsidiary companies with his office in Pittsburgh, Pa. Prior to his joining the West Penn, Mr. Swinney was associated with the American Telephone & Telegraph Company, serving for three years as staff accountant to the comptroller at the New York office. Mr. Swinney's previous business connections were with the Interstate Commerce Commission at Washington, with which he worked for ten years, in the latter period as assistant director of accounts. He also served as traveling auditor for the St. Louis Southwestern Railway, with office at St. Louis. He is a native of Florence, Tex. He received his education at Lockney College in that state.

H. H. Hanson Heads Middlesex & Boston Street Railway

Harry H. Hanson, who has served as vice-president and general manager of the Middlesex & Boston Street Railway, Waltham, was elected president of the corporation effective on Dec. 1. In this capacity he succeeds Pitt F. Drew, who has been chosen chairman of the board of directors.

Mr. Hanson entered railway work in 1889 as a conductor for the Boston Elevated Railway. Through the various grades in the operating department he advanced, becoming district supervisor in 1901, at the Dudley Street terminal, Roxbury district. In 1913 he was appointed superintendent of District No. 2, and served in this capacity until he



H. H. Hanson

was transferred to work of more responsibility. He served as superintendent of Division No. 7 for two years, with headquarters at Cambridge. Mr. Hanson became general superintendent of the Middlesex & Boston Street Railway in 1919, continuing in that capacity until his promotion to the general managership in 1926.

OBITUARY

Gen. Charles Miller

Gen. Charles Miller, 84 years old, retired oil millionaire and one of the founders of the Galena Signal Oil Company, died at his home in Franklin, Pa., on Dec. 20.

General Miller until eleven years ago was president of the Galena Signal Oil Company, and a son, J. French Miller, is now secretary-treasurer. He was Franklin's foremost resident, noted for his liberality and for many and varied interests. Heart disease was the cause of death.

He came to the United States from Alsace, France, his birthplace, while still in his teens, and his first occupation was selling sewing machines. His business career was interrupted by his service with the Union Army during the civil war and since that time had shown a keen interest in military affairs. Franklin's first modern hotel, the Alsace, was built by the General.

At the time of his death he was president of the Lake Erie, Franklin & Clarion Railroad, which he built 22 years ago; president of the Franklin Railway Oil Company and of the General Manifold Printing Company. He had an interest in the Hotel Latham of New York city and was a frequent business visitor in New York.

Harvey Hubbell

Harvey Hubbell, president of Harvey Hubbell, Inc., Bridgeport, Conn., manufacturer of electrical devices, died on Dec. 17 at his home in that city. A leader in the machinery field, Mr. Hubbell had to his credit more than 100 patents for his inventions making for the perfection of electrical switches and sockets and machine tools. He was born in Brooklyn, N. Y., and received his technical education at Cooper Institute in New York. His early experience was obtained with builders of printing presses and in ship and marine engine works. In 1888 Mr. Hubbell removed to Bridgeport to establish a small plant, and seventeen years later he incorporated the business, of which he was president for many years, under its present name.

E. P. Morris

Elmer P. Morris, 65, died on Dec. 11 at his home in East Orange, N. J. For a long while he was head of E. P. Morris & Company, New York, dealers in railway equipment. In 1889 the Cincinnati Street Railway, then the Cincinnati Traction Company, decided to electrify its horse car line on Colerain Avenue for a distance of about 6 miles. Bert Baldwin was employed to study the few electric railway lines then in operation in the United States and following his recommendations contracts for the Cincinnati work were awarded to the Thomson-Houston Company, Lynn, Mass., now a part of the General Electric Company. It was Mr. Morris, then employed by the Eastern company, who is said to have decided upon the double trolley system, still in use in Cincinnati. Later, Mr. Morris established himself in business in Cincinnati, but subsequently he returned to the East.

LOUIS A. CHRISTIANSEN, principal of the Corporation Service Bureau, Cleveland, Ohio, died recently. Mr. Christiansen was a member of the American Electric Railway Association for a number of years and was known for his work as an investigator. In solving problems of all sorts he co-operated with a number of electric railway officials. The Corporation Service Bureau will continue to operate as it has in the past.

Manufactures and the Markets

No Cars Destroyed in Recent Ohio Carhouse Fire

No cars were lost in the recent fire which destroyed the carhouses and shops of the Columbus, Delaware & Marion Electric Company at Stratford, near Delaware, Ohio. Recent advices are that temporary buildings are practically completed for handling and running repair work.

Stock Dividend Declared by Ohio Brass

The Ohio Brass Company, Mansfield, Ohio, has declared a 20 per cent stock dividend on class "A" and "B" shares, payable in class "B" shares to stock of record Dec. 27. The company also declared quarterly dividends of $1.25 on the class "A" and "B" stocks and $1.50 on preferred, payable on Jan. 15 to stock of record of Dec. 31. The new class "B" stock will participate in the dividend.

Kansas City, Leavenworth & Western Gets New Cars

Four new cars embodying the latest features of safety, comfort and economy in electric railway equipment were recently introduced by the Kansas City, Leavenworth & Western Railway, Kansas City, Kan. The order for these cars was noted in the ELECTRIC RAILWAY JOURNAL Aug. 13 and description, specifications, elevation and plan appeared in the Nov. 5 issue.

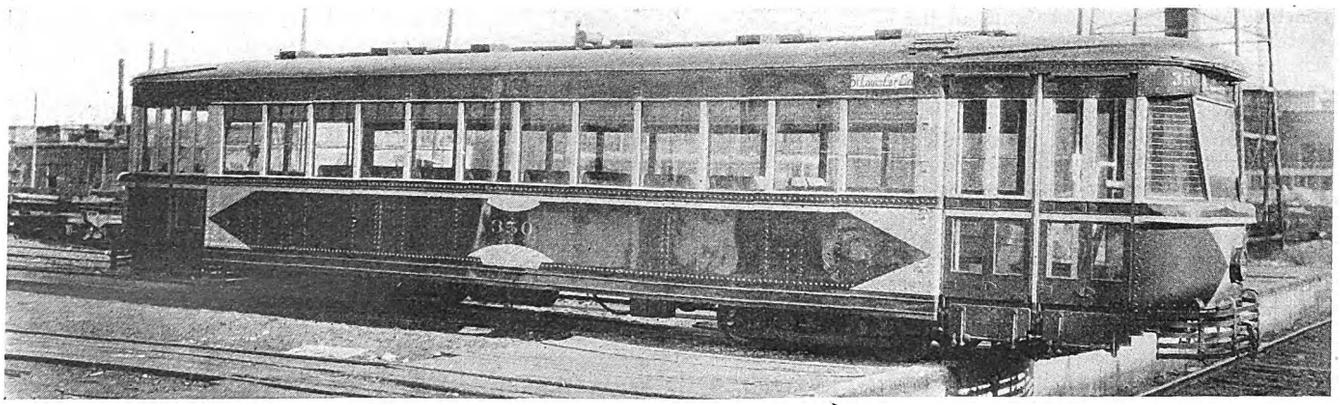
The installation of these cars, it is reported, climaxes a year's activity in which $100,000 has been spent rehabilitating the line.

V.E.P. Expects Recent Bus Order Deliveries in January

Bus equipment ordered recently by the Virginia Electric & Power Company will be delivered early in January, company officials expect. The ten new buses ordered, at a cost of $120,000, will have seats for 40 persons each.

One of the new type of vehicles which has arrived resembles a one-man street car. Its motor is located in the center of the vehicle to reduce the wheelbase. Some of the 29-passenger buses now in operation here, it is reported, have difficulty negotiating turns at narrow street intersections.

Five One-Man, Two-Man Cars Received by East St. Louis & Suburban



Typical exterior of the five new one-man, two-man city type cars recently put in service by the East St. Louis & Suburban Railway, East St. Louis, Ill. Note the streamline effect obtained by the color scheme

FEATURED with a parade headed by Mayor Frank Doyle and other city officials, five one-man, two-man, city type cars were inducted into service Nov. 23 by the East St. Louis & Suburban Railway, East St. Louis, Ill. The cars, which were ordered from the St. Louis Car Company early in the summer and for which specifications were printed in the JOURNAL for July 9, will be used on the State Street and 42d Street lines. One of these cars was exhibited at the Cleveland convention last October under the name of the "President's Car" or "Rail Sedan." When placed in service the new cars were operated free of charge during the first day. The units supplement the service of six rebuilt cars which were put in operation May 7.

Subjoined are specifications:

Number of units	Five
Type of unit	One-man, two-man, motor passenger, city, double-end, double-truck
Number of seats	48
Builder of car body	St. Louis Car Co., St. Louis, Mo.
Date of order	May 24
Date of delivery	October, 1927
Weight, approximately	32,000 lb.
Bolster centers	22 ft.
Length over all	47 ft. 3 in.

Ample aisle room, light, and comfortable leather-covered seats are some of the features of the new East St. Louis cars, which were built by the St. Louis Car Company

Length over body posts	31 ft. 4 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 6 in.
Height, rail to trolley base	10 ft. 6 in.
Window post spacing	2 ft. 6 in.
Body	All steel
Roof	Arch
Doors	End, folding
Air brakes	Westinghouse
Axles	Heat-treated
Car signal system	Faraday
Compressors	DH-16
Control	K-75, low level
Curtain fixtures	National Lock Washer
Curtain material	Pantasote No. 86
Destination signs	Hunter
Door mechanism	National Pneumatic
Energy-saving device	Economy meters
Finish	Enamel
Floor covering	Linoleum
Gears and pinions	Tool Steel Gear & Pinion Co.
Glass	Plate in side windows; non-shatterable in vestibule
Hand brakes	St. Louis Car Co.
Hand straps	Electric Service Supplies No. 26572
Heaters	Consolidated
Headlights	Golden Glow
Headlining	Agasote
Interior trim	Mahogany
Journal bearings	Plain 3½ in. x 7 in.
Journal boxes	St. Louis Car Co.
Lamp fixtures	Safety Car Lighting, dome fixture
Motors	General Electric No. 264, inside hung
Sash fixtures	Dura
Seats	St. Louis Car Co., leather reversible
Seat spacing	30 in.
Seating material	Genuine Spanish leather
Steps	Folding
Step treads	Feralun
Trucks	St. Louis Car Co. EIB 64
Ventilators	Nichols-Lintern
Wheels, type	Rolled steel, diameter 26 in.
Special devices	Oakelite; National Pneumatic treadles; variable load brake

$900,000 New Equipment Program of North Shore

New equipment and rolling stock costing more than $900,000, it was recently officially announced, are being built for the Chicago, North Shore & Milwaukee Railroad, Chicago, as a part of an extensive program of enlarging facilities in all branches of its service. The equipment is of the latest design and all of the units are scheduled to be in service by next summer.

The largest single item in the program consists of fifteen all-steel, passenger, motor cars ordered from the Pullman Car & Manufacturing Corporation, Chicago, on Oct. 1 and reported in the ELECTRIC RAILWAY JOURNAL Oct. 22. The cars will be equipped with individual bucket type easy chairs upholstered in gray byzantine plush. One of the cars will be equipped with Hyatt roller bearings to test the riding comfort of cars thus equipped in high-speed electric operation. There will be two toilets and a smoking compartment in each car. Deliveries are expected next May.

Two additional dining cars and another parlor-observation car of all-steel construction are also being built for the North Shore Line at the Pullman plant. The diners seat 24 persons each. The cars are to be delivered to the road next May.

The fifteen additional semi-trailers for freight service of 8-ton capacity, scheduled for delivery in December by the Trailmobile Company of Cincinnati, Ohio, are to be used in handling door-to-door shipments. The units are mounted and transported between stations on flat cars with the trailer wheels still attached and without any handling of merchandise from the time the shipment leaves the shipper's door until it reaches the consignee.

Three 5-ton gasoline tractors were recently delivered to the railway by the White Motor Company of Cleveland, Ohio, and are now in service. The tractors are used in hauling trailers to and from freight receiving depots in Chicago and Milwaukee. The North Shore Line is the first railroad in the United States, it is understood, to place flat car trailer equipment of this type in regular service.

The ten lightweight, double-truck, one-man, two-man safety cars ordered from the St. Louis Car Company for service on Milwaukee city divisions of the North Shore Line are expected to be delivered about the last of the month. Announcement of the placing of the order appeared in the July 16 issue of ELECTRIC RAILWAY JOURNAL. These cars, which are 51 ft. long, have a seating capacity of 56 persons each and the seats are upholstered in green plush. Designed for either one-man or two-man operation, the cars are completely equipped with safety devices. Two of the cars will be equipped with Timken roller bearings.

The two additional freight locomotives built by the General Electric Company, the first of their type ever constructed, are equipped for operation either on trolley or storage battery circuits. They are 40 ft. long and weigh approximately 131,000 lb. each.

Fifty New Cars for Seattle

The contract for fifty new cars intended for use on the Seattle, Wash., lines of the Seattle Municipal Railway is to be awarded to the Pacific Car & Foundry Company, Seattle, under a plan for financing to which reference is made elsewhere in this issue.

Twenty-seven Thousand Employees Bondholders

Twenty-seven thousand, or 42 per cent, of the employees of the General Electric Company in its service for six months or more are holders of about $30,000,000 face value of G.E. employees' securities corporation bonds, an average of approximately $1,000 per person. These bonds pay 6 per cent interest, but so long as the original holder remains in the employ of the General Electric Company an additional 2 per cent is paid by that company.

ROLLING STOCK

MILWAUKEE ELECTRIC RAILWAY & LIGHT COMPANY, Milwaukee, Wis., is equipping one of its interurban articulated dining and passenger car units with Hyatt roller bearings. The company has been using Hyatt bearings under one of its articulated city units for approximately two years.

SHOPS AND BUILDINGS

MILWAUKEE ELECTRIC RAILWAY & LIGHT COMPANY, Milwaukee, Wis., and its subsidiary, the Wisconsin Motor Bus Lines, it is reported, will house all of their buses operating out of Racine, Wis., in the new bus storage building being erected in that city at a cost of about $10,000. The building will accommodate 30 buses. It will measure 48 ft. x 150 ft.

TRADE NOTES

WHITE COMPANY, Cleveland, Ohio, has recently announced the following promotions: W. C. Pahlman, manager of the company's branch at Wichita, Kan., to manager at Oklahoma City; E. O. Bittner, former Tulsa, Okla., company salesman, to manager at Wichita.

HYMAN-MICHAELS COMPANY, Chicago, has recently been appointed sales agent for the Mid-West territory of the Ohio Locomotive Train Company and its subsidiary, the Toledo Crane Company, manufacturer of locomotive trains, overhead traveling and gantry cranes, steam, electric and gasoline operated.

AMERICAN HAMMERED PISTON RING COMPANY, Baltimore, Md., through W. C. Stettinius, president, has announced the election of T. Latimer Ford as vice-president. For a number of years Mr. Ford was assistant secretary and treasurer of the company and for the past four or five years has had charge of the Pacific Coast territory. In addition to his executive duties he will have charge of automotive replacement sales. His headquarters will be at the main office in Baltimore.

LUDLUM STEEL COMPANY, Watervliet, N. Y., has issued a loose-leaf booklet which it advises is devoted to a treatise on the new Nitriding process for the hardening of steel. The publication is entitled "Nitrolloy and the Nitriding Process." The following subjects are taken up in six chapters: "Nitralloy and the Nitriding Process." "The Analyses of Nitralloy," "The Physical Properties of Nitralloy," "The Operations Prior to Nitriding," "The Nitriding Process and Equipment" and "The Properties of the Nitrided Case." It also contains a tabulation of nitralloy-physical properties as well as some charts.

ADVERTISING LITERATURE

ELECTRIC SERVICE SUPPLIES COMPANY, Philadelphia, Pa., has issued an illustrated folder descriptive of its Golden Glow headlight.

IRVING IRON WORKS COMPANY, Long Island City, N. Y., has recently issued an illustrated bulletin, 2D, descriptive of its "Safkar Safstep."

ARMCO CULVERT MANUFACTURERS ASSOCIATION, Middletown, Ohio, has recently issued a booklet entitled "Paving the Culvert to Combat Erosion."

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has sent out looseleaf bulletins GEA-37B and GEA-528A, descriptive of direct-heat electric furnaces types AD, RRB and RRC and centrifugal air compressors, small, multi-stage respectively. It has also issued another looseleaf bulletin, GEA-573A, entitled "Automatic Switching Equipment," covering synchronous converters in railway service.

Overlapping Sectional Meetings Cut Attendance

ON SEVERAL occasions the JOURNAL has called attention to the overlapping of sectional association meetings. During the month of January there are scheduled four such meetings, each of which interferes with one or more of the others. This is undesirable from several standpoints, most important of which is the reduction of attendance at the meetings themselves.

Manufacturers in particular suffer from this unfortunate circumstance. Instead of covering several sectional meetings by routing a man so as to attend them on one trip, it frequently becomes necessary to send out several men for long distances, or to omit attendance at one or more meetings. This does not apply only to manufacturers. In some instances alert operating organizations send men outside the confines of their own territory to attend neighboring sectional meetings. Overlapping dates discourage such a progressive policy. Again, there has grown up during recent years the desirable practice of inviting officers or staff members of the American Association to address sectional meetings. Simultaneous meetings in several widely separated locations sometimes make it impossible for association executives, who would otherwise do so, to lend this desirable co-operation.

In the last analysis, offending associations are themselves the greatest sufferers from carelessness in setting meeting dates. In rare instances these dates are fixed in the association's constitution or by-laws. When that is so there seems to be no good reason why two overlapping associations should not take up this matter with each other and agree upon changes to be made in their constitutions at the first opportunity. Most conflicts, however, are attributable to lack of proper checking when the dates for meetings are fixed by executive committees.

The JOURNAL has endeavored to aid in relieving this situation through publication every week of meeting dates as promptly as they are announced. These dates are carried in the calendar every week until the meeting is held. The JOURNAL will be glad to co-operate further with sectional associations by answering promptly any inquiries regarding conflicting dates at the time a sectional meeting is being planned.

Regulation of Interstate Motor Carriers an Issue Again

CONGRESS again has before it the question of the regulation of buses and trucks engaged in interstate commerce. The two bills so far presented are the so-called Parker and Dennison measures, but the House committee on interstate and foreign commerce will not act on any bill until the report of the Interstate Commerce Commission on Docket 18,300 is presented. Oral argument on the commission's docket is now set for Feb. 10.

Opinion appears to be as divided as ever about the need of regulation and the methods that should be adopted to bring the interstate carriers within regulative purview greater than that afforded the states at present through the exercise of their police powers. The far-fetched view, perhaps, is that need for regulation does not exist. The saner view is the one which has as its object a measure of regulation that will not have the effect of strangling the development of the industry. Each plan so far advanced has its able advocates. There may be good reasons for the advocacy of the plan of conferring jurisdiction on the local commissioners, with the I.C.C. as a court of last resort only in the event that matters in dispute cannot be otherwise settled.

It is, of course, too early to attempt to predict the probable outcome. The position of the electric railways in the matter has been stated in their brief. If the opinion of Interstate Commissioner Esch is a criterion, then that body is not in sympathy with the idea that regulation of the interstate bus carriers should be deferred. According to him, had Congress regulated traffic by rail carrier years earlier much of the time and labor of the I.C.C. might have been avoided, and many actions now brought to the commission for consideration might have been obviated. Certainly regulation is the order of the day. The many electric railways that have supplemented their rail service by the operation of buses have sought authority from the states or municipalities, and it is true that such operation by the electric railways is frequently subject to competition from bus lines engaged in interstate business and subject only to the local police power.

Despite the need of protecting the electric railways, the steam lines and the certificated bus lines from encroaching upon each other, it is important that grave injustice be not done to one or more of these interests. Even a continuation of the present unsettled state, deplorable in many of its aspects, is better than ill-advised legislation that might work hardships greater than the evils it was intended to correct.

Schedule Speeds Can Be Improved

SCHEDULE speeds on many electric railways have not seen improvement commensurate with the trend of the times or the demands of the public. While this is true of some large properties, it is particularly noticeable on the smaller systems. Unfortunately, it is in the small cities that the need for improvement is most apparent. As a rule, in the small cities the speeds always have been lower than in the large ones. It is in the small cities that the opportunity for active competition by the private automobile is greatest. The small systems with infrequent service and short runs do not, of course, give the opportunities for saving cars by speeding up that are evident where the headways are close and the lines

Digitized by Google

are long. Often the remark is made by a manager that the operators might just as well be spending their time in dragging their cars over the road as to hurry through and then loaf at the terminals.

From a standpoint of manual efficiency this may be true, but from the standpoint of winning public support it is far from correct. One of the standing complaints of the railway patron is that while the street car is moving slowly and majestically along the street all the other traffic is passing by and leaving it in the rear. Even though it may be proved that the car gets to its destination only a minute or two later, that does not pacify the rider who is annoyed by the slowness of the car. After he has had his fill of it he buys an automobile. Soon he joins the ranks of the agitators who want the trolley tracks torn up.

As an indication of how bad the situation may be in some cities, and of how much it can be improved, the experience in Charleston, S. C., is worthy of note. Here the schedules a few years ago called for an average speed of 7.5 m.p.h. Contrast this with the 10 to 11 m.p.h. maintained on some of the largest metropolitan systems! Furthermore, only 77 per cent of the cars were on time. During the past four years the speed has been raised to 9 m.p.h., an increase of 20 per cent or one minute out of every five. While the trainmen declared it couldn't be done, the latest check showed that 95 per cent of the cars were operated on schedule. Most surprising of all, the increase took place while one-man operation was being largely extended, and while there was a marked increase in traffic congestion.

It is beside the point to argue that this required hard work. Of course it did. It required a good organization and the co-operation of every employee from the top down. The big point is that it could be done and that it was done. What is more, there is no inherent reason why similar results cannot be obtained in practically every city where the schedule speed is too low. And in the doing of it there is great reward.

Changing Conditions Affect Interurban Headlight Efficacy

PRESENT headlight equipment of interurban cars was designed principally to aid the motorman in detecting objects on the right-of-way. The headlight mounted atop the car roof may serve its primary function of illuminating the track ahead effectively for the motorman, but it is sometimes ineffective as a warning to the driver of a highway vehicle about to cross the track. The hazard of the highway crossing is one of growing seriousness, both on account of the increasing number of vehicles and in their greater speed and the apparent recklessness with which that speed is used by the driver. Conditions are worst at night, particularly when there are few vehicles on the road and they are driven at breakneck speed.

The motorist of today has learned to interpret traffic dangers in terms of light signals. With the advent of the closed types of automobiles auditory warnings have in a measure become ineffective. This is particularly true during inclement weather, when the vehicle windows are closed and the noises of the wind tend to mask the sound of a warning signal. Lights guide the motorist through the complexities of city traffic, and on the highway lights produced directly or by reflection mark road curves, S turns and other danger spots. They flash a visual message that is unmistakable in its import.

Under certain conditions the beam from the headlight on the roof of an interurban car may be out of range of the motorist's vision. Observation of cars approaching highway crossings at night under varying roadway conditions indicates the need for giving more careful consideration to the position of headlights on the interurban car than has been paid to the subject in the past. On some properties cars which use a brilliant headlight on the roof also carry a second headlight on the dash. In such instances the practice has been adopted rather to meet the conditions of operation on city streets than those presented by highway crossings on the open road.

In view of the increasing seriousness of the crossing hazard, this matter of headlight equipment for interurban cars seems worthy of serious study.

Prudent Stewardship Indorsed

CONFIRMATION of the disposition of its earnings has been rendered in favor of the management of the Third Avenue Railway, New York, by the United States District Court. In some respects the issues raised in this case appear to be purely academic, but they are, on the whole, much more than one for the technician. They relate to the rights of the management to retain funds which a holder of income bonds thought should have been applied to the payment of interest, accumulated to the extent of 27¾ per cent as of Sept. 24. The man who sued sought to estop the company from using the property of bondholders for capital purposes "in direct violation of the trust indenture securing the bonds." The management said that the indenture provided that disbursements on the bonds were at the discretion of the directors. Briefly, the position of the management was that it was acting fully within its rights when it withhheld payment of interest so as to conserve its cash for use in the emergency of the ever-changing railway situation in New York, but particularly to meet the contingencies before it in the franchise applications then pending for the right to run buses in the city.

The court has now held that the management did right in acting as it did. The court apparently did not pass upon the terms of the indenture under which the bonds are secured, but the ruling is no less clear on that account. Judge Knox held, in effect, that the company's position in the premises was justified, since with the bus lines in the hands of an antagonistic company the routes of the railway and the bus company would have been sharply competitive. The decision, however, is not one that might be construed as conferring upon companies having income bonds outstanding the right to pay or withhold interest at will. That was never the original intention of the income bond as a financial device, and any such construction would indeed be detrimental to the income bond as a very valuable form of financial media. The court merely ruled on the specific points raised, saying that the accounting sought by the plaintiff might show facts which would entitle him to relief, but that it was not satisfied, upon the basis of the present disclosures, that the plaintiff should have the injunctive relief he sought.

It would seem reasonable to assume, as has been pointed out before, that the holder of a security of this kind labors under no delusion about the type of security he is purchasing. He knows that financially its owner-

Digitized by Google

ship implies hazards, and those hazards are lessened for him only as the management exercises caution. It might, it is true, seek as soon as possible to liquidate any payments that have accumulated and denude the property of cash so quickly as to leave it again in a position out of which grew the necessity for issuing the income bonds. If it did that knowingly it would not be true to its trust.

Under the circumstances in the Third Avenue case, it does not appear that any decision could have been reached other than that arrived at by the court. Certainly the management in this case was acting in the remote interest of the owner of the bond and in so doing was protecting him and his capital. The withholding of the interest payment was merely incidental to the larger and more important one of preparing the company to cope with a situation that arose. The attitude of the company toward the proposition was well advised, as the court ruling indicates.

Car Rider's Viewpoint Not Always Properly Understood

MANY managers of electric railways find that one of the most successful means of providing the service that the public wants is to put themselves in the place of their patrons. In other words, the executive of the company himself becomes a regular passenger on his own cars. Sometimes the plan is carried even farther, and members of the organization not directly connected with car operation are delegated to ride and to report on the desires of the public as well as possible sources of irritation and plans for their elimination. When this plan is followed it tends definitely to keep the management away from the frame of mind where the officials feel that they know instinctively what is best for the public, and propose to run their own roads regardless of what the riders think they want. When a plan of this kind is followed it may make for efficient operation. But there is more than mere efficiency to operating a transportation system successfully. The service must also be convenient and comfortable.

At times the requirements of efficiency in operation and passenger convenience conflict with each other. Then accurate knowledge of the car rider's viewpoint is indispensable. Determination of the correct procedure under such circumstances cannot safely be left to subordinate operating men. While the efficiency—or the lack of it—becomes a matter of record, the effect on public opinion is not definitely registered. For example, a car turned back short of its regular destination to fill in a gap in the opposite direction shows up well on the headway record for the day. But there is no way to chart resentment of the passengers compelled to change cars. Similarly, running by waiting patrons may tend to correct uneven spacing of cars and hence produce a good result on paper, but it produces an extremely bad effect on public relations. Even the railway manager himself would wax wroth if he stood on the street corner and was passed up by one of his own cars. Anyhow it would be worth a good deal to him to try the experiment himself and learn just how it seems.

These efficiency measures usually are adopted in the name of "the greatest good for the greatest number." In many instances their claim to accomplish that result is justified. But the individual passenger cares nothing about "the greatest good for the greatest number." He is thinking only of the greatest good for himself. One incident that inconveniences him makes a deeper impression than ten that benefit him. Often other corrective measures can be taken that will not discommode the patrons of the road. When it is necessary to discommode them, every effort should be made to inform them of the reasons for a change from normal operation. By so doing many a friend can be made—and in these days good will of the public, while hard to evaluate, is no mean asset.

An Obligation That Should Not Be Assumed Lightly

CONSIDERABLE attention has been given in recent months to plans for pensioning superannuated employees in all classes of American business. Irrespective of the desirability on social or moral grounds, it is a movement that has been gaining favor in many places. Looking at it in a dispassionate way, it is merely a plan to force the employee to save systematically whether he will or not. As it was pointed out in the article in this paper for Dec. 3 by E. C. McDonald, the plan is largely one for the actuary. With the same accuracy with which life insurance premiums can be calculated, it is possible to determine the amount that should be set aside each year to provide the needed fund at the retirement age to make payments to the beneficiary for the remainder of his life. There is no magic in it and virtually no guesswork.

When such an obligation is taken on by the employer, by the employee or both, it is necessary to be certain that it can be carried through without fear of failure. Of course, every cent that is set aside is saved, and nothing is lost, if the money is invested in such a manner that safety of principal is assured. It is when questions come up such as those raised in Australia, which were presented by W. O. Strangward, secretary of the Melbourne and Metropolitan Tramways Board, that a shadow of doubt arises whether both parties to the contract will be able to fulfill their obligations.

Mr. Strangward points out that the contribution of the company is really equivalent to deferred wages, and since it must come out of fares, it is doubtful if the rates can be raised sufficiently to produce the needed revenue. It is wrong to agree to the payment unless the accruals cover the entire term of service of the employee, as to defer them would be merely passing on to a future generation the duty of paying the employee, and would at that time make the burden so great that it might be irksome. Even when the payments are made from the beginning the amount is so great that it may cause distress.

In fact, in Australia itself the question of failure to accrue funds sufficient to care for pensions has already become apparent. For instance, in New South Wales the amount to be raised annually from employee contributions has been reduced greatly and the deficiency is to be made up by the state. Even though the plan has been in effect only a little more than ten years, the government is short by some £2,000,000 to £3,000,000, and is planning to refund the arrears over a long period of years.

In view of a situation such as this the greatest care should be taken before a pension system is undertaken. It must be fundamentally sound or it will be impossible to carry it through. Furthermore, the employee should be given to understand that it really is a plan to assist him in emulating the ant and not the grasshopper.

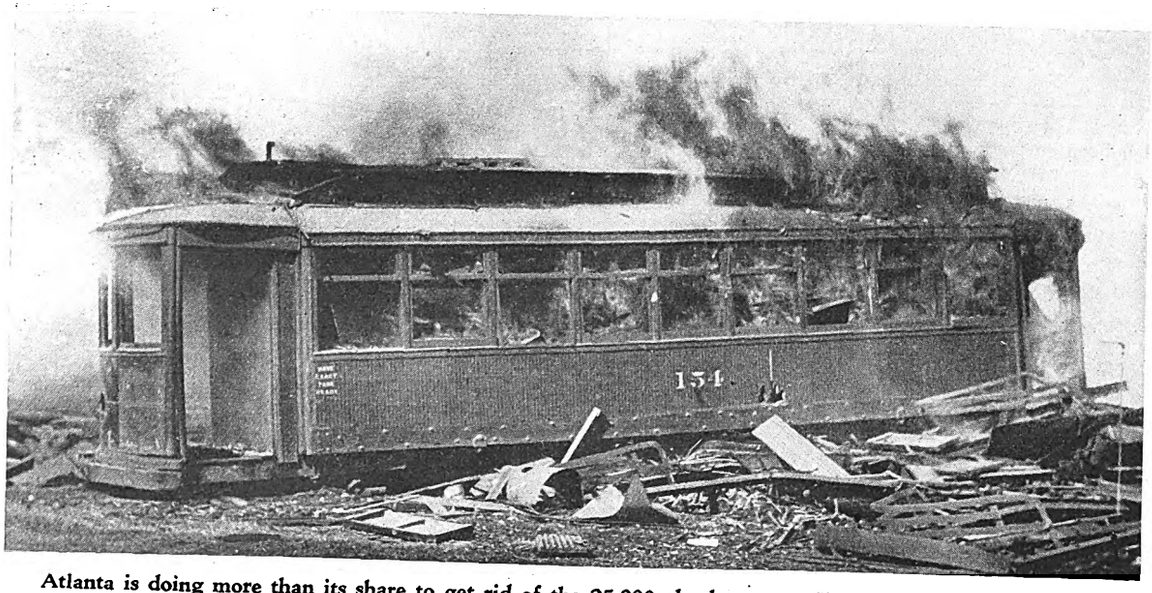
Atlanta Builds for the Future

With New Cars and Better Service

Convinced that modern equipment and improved service will ultimately win public patronage and support, the Georgia Power Company, in its brief for the Coffin Award, outlines the courageous policy that has finally brought an upturn in the earnings on its investment



Atlanta is doing more than its share to get rid of the 25,000 obsolete cars. Since 1921, 178 cars have been retired, 176 burned and two given away

CONFIDENT that new cars and, therefore, better service are the real answer to increased revenue and the ultimate support of the public, the Georgia Power Company, Atlanta, Ga., and its predecessor company, the Georgia Railway & Power Company, have been buying cars steadily since 1921, in the face of a declining curve of earnings on the investment. Some idea of the extent to which the present company believes in better service is gained from the knowledge that it has spent over five million dollars in service improvements since 1921, and the budget for 1927 will add more than a million and a quarter dollars to that already invested.

The present operating exceutives took charge in 1921 and almost immediately purchased 33 cars, followed in 1922 and 1923 by orders for twenty cars during each year. In 1925 sixteen new units were added and the following year saw seventeen additional new cars in service, bringing the total to 203 cars in 1926. As recently announced in ELECTRIC RAILWAY JOURNAL, the company placed an order this spring for 40 more units, which will bring the new equipment total to 243 cars purchased over a period of seven years.

The 1926 car orders place the Georgia Power Company in the position of having purchased nearly 2 per cent of all of the new passenger cars for city use that were bought in the United States during the last six years. The extensive car purchase program and the retirement of 178 old units has reduced the average age of the passenger equipment from 13.6 years in 1921 to 8.6 years in 1926.

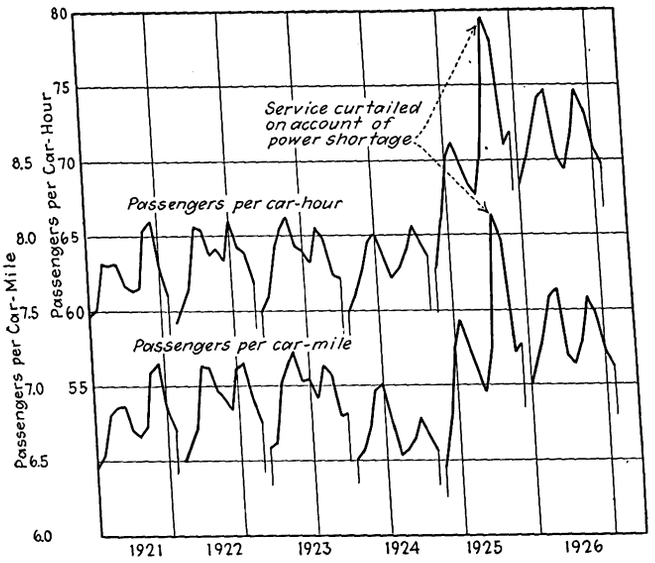
The schedule of retirement of old cars, most of which were more than twenty years old, is as follows:

Years	Number of Cars Retired	Years	Number of Cars Retired
1921	10	1925	60
1922	..	1926	76
1923	20		
1924	12	Total	178

With the retirement of fourteen old cars this year and the placing in service of the 40 cars scheduled for delivery in September, the average age of all cars, city and interurban, will be 7.4 years. For the city cars only the figure is 7.7 years. This contrasts with the following figures: Dec. 31, 1921, 13.5 per cent of the cars in service were less than five years old. On Dec. 31 this year the rolling stock less than five years old, 210 cars out of 449, will be 46.75 per cent of the total on the property.

Some of the tangible results of the improvements made in Atlanta may be seen from a review of operating and revenue statistics which show the company's unswerving faith in its policy of concentrating on improved equipment and better service as the means of winning

Digitized by Google



There has been an increase within recent years in passengers per car-hour and per car-mile

public patronage despite the fact that until 1926 revenues showed a downward trend. The per cent return on value of property from 1922 to 1926 follows:

1922	3.03	1925	1.32
1923	2.70	1926	2.34
1924	1.87		

From this it will be seen that the company lost ground steadily from 1922 to 1925, but that there has been a sharp upward trend in the return on the investment between 1925 and 1926, with the promise of a further climb during the present year.

Passenger Riding Increased

The record of passengers carried indicates the wisdom of the company's policy. The total number of passengers carried in 1926 was 96,794,273, as against 91,358,379 in 1921. Revenue passengers increased from 73,611,786 in 1921 to 75,901,241 in 1926. Taken by years, the total passengers carried were as follows:

1921	91,358,379	1924	92,029,437*
1922	92,172,664	1925	94,636,746
1923	95,357,117	1926	96,794,273

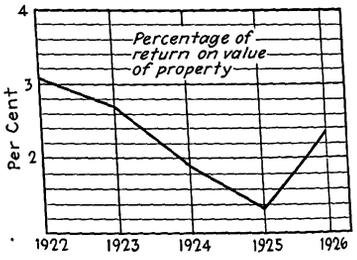
*Jitney competition.

The company's statement of gross revenue, total operating revenue, total operating expenses and net operating income before taxes for the years 1921-1926 inclusive are given in the accompanying table.

On the fourteen lines in Atlanta, where obsolete cars have been replaced by new cars, there has been an average increase in patronage of 4.73 per cent within three to six months following the installation of the units in service. The average increase on the balance of the system during this period was only 0.772 per cent. In the matter of increased riding as the result of new cars there is cited one route on which the installation of the new cars was followed by a business increase of 21.4 per cent for six months as compared with the corresponding period in the preceding year. On another route 13.5 per cent increase was obtained, while the system increase was 1.8 per cent. Increases of about 13 and 12 per cent, respectively, are shown on two other routes following the installation of new cars.

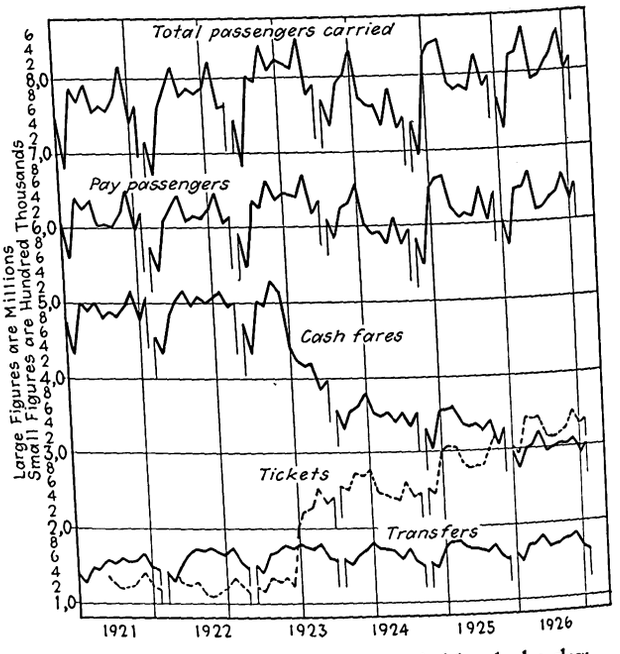
One-Man Cars Successful

When making its new car purchases the Atlanta company determined to give the one-man car a thorough test, a decision that has been productive of splendid results, both from the standpoint of increasing the car men's wages and solving the great Southern problem of race separation. Reduction of accidents also is attributed to the introduction of this type of car, which the company placed in service during 1925.



The percentage return on the value of the property is tending upward

At present 110 units in operation are arranged for one-man operation and the 40 new cars to be delivered this month are of this same type. Twenty additional cars which permit of ready conversion to this type will be changed during this year. One-man operation is used on all interurban lines and during rush hours 32 per cent of the service is of this nature. The management has found a $1,700 per car annual platform expense saving in one-man operation over two-man operation. After deducting interest charges and depreciation, approximately $720 per car per year has been saved. This



The line showing pay passengers carried has had a slow but continuous growth

GROSS REVENUE, OPERATING EXPENSES AND INCOME, 1921-26, GEORGIA POWER COMPANY

	1921	1922	1923	1924	1925	1926
Gross revenue from transportation	$5,160,784.85	$5,106,816.38	$5,244,204.79	$5,043,959.27	$5,134,918.60	$5,257,314.73
Total operating expenses	3,536,691.18	3,680,186.48	3,834,575.28	3,767,554.67	3,867,033.58	3,893,125.01*
Net operating income before taxes	1,624,093.67	1,426,629.90	1,409,629.51	1,267,404.60	1,267,885.02	1,364,189.72

* Includes $129,459.05 retirement expense and $43,500 rental of equipment, a total of $172,959.05 not charged to operating expenses in previous years.

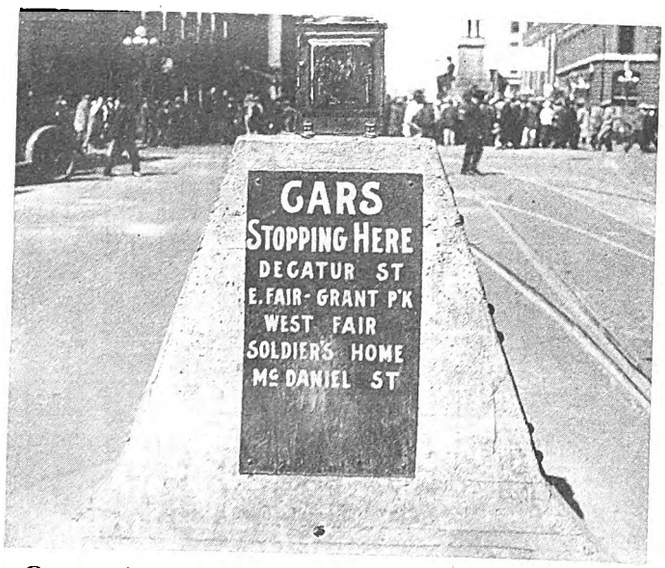
Digitized by Google

saving is allocated to give 50 per cent to the public in additional service, 25 per cent to operators in increased wages and 25 per cent to the company in increased earnings.

Every one familiar with the race question in the South knows that it is difficult, especially where congestion is present. The one-man cars adopted by the Georgia Power Company have the treadle step rear door mechanism. This has reduced race contact materially and has brought forth unqualified praise. With rear door operation there is no definite dividing line separating sections of the cars to be used exclusively by each race. The practice is for the negroes to occupy the seats from the rear forward, and the white patrons vice versa. Although at first it was found that the one-man type was productive of more accidents, familiarity of the public and trainmen with the new cars has grown to such an extent that in April, 1927, accidents on one-man cars were just about equal to those on two-man cars.

Perhaps one of the most interesting phases of the one-man situation in Atlanta was the lack of opposition encountered when this type of unit was first placed in service. The company took a novel means of introducing them to the public. This consisted of a contest to decide what color scheme the public liked best. Two of the cars were painted in the proposed new colors, green and cream and red and cream. One of the older cars was painted in solid green, the former color standard. These sample cars were placed in front of the company's building and the public was invited to cast ballots, the result being that more than 20,000 ballots were cast for the green and cream color scheme.

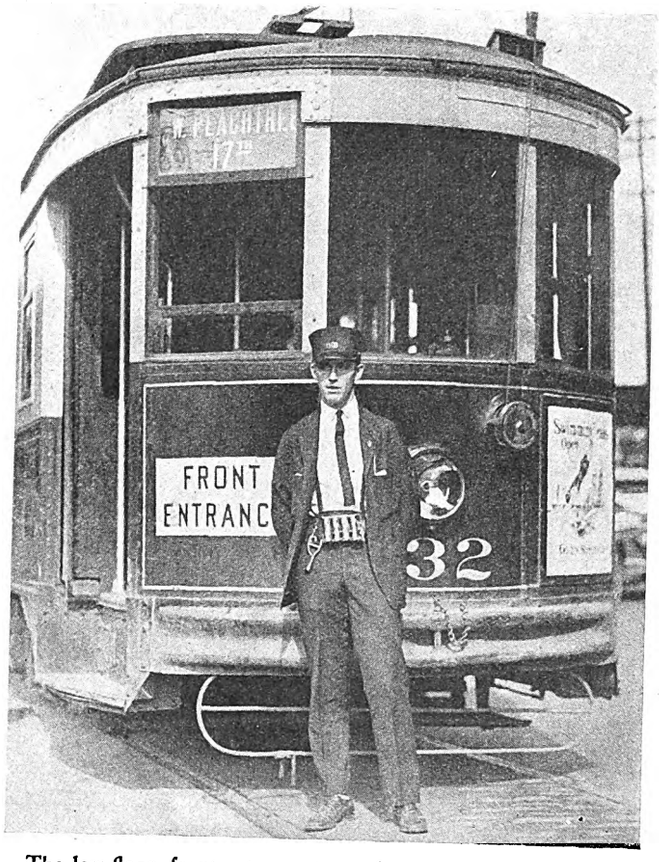
Among the 203 new cars purchased since 1921 are 100 double-truck, four-motor safety cars, with safety air brake equipment, door engines and treadle mechanism.



Car stop sign, with information on routes passing that point, attached to buttress of loading platform

There are 40 double-end cars with automatic couplers and air brake equipment for two-car-train service. Ten cars are of the single-end safety type with automatic couplers and air brake equipment for two-car-train service. Another twenty units are double-truck, double-end, two-man cars with straight air brake equipment and equipped with door engines and pneumatic control.

Replacement of ten old type interurban cars with lightweight one-man cars brought about a total reduction in car weight from 315 tons to 189 tons. All the new units



The low-floor, front-entrance type of one-man car which was recently put in service

have cheerfully finished interiors, wide aisles and thermostatic heat control. In the new interurban cars the de luxe appointments are much in evidence. Besides leather-upholstered individual seats the cars are provided with smoking compartments, generously upholstered arm rests, foot rests, dome lighting, parcel racks and ticket holders. On both the city and interurban units the side sheathing and door pockets are insulated with cloth and covered with canvas as a noise prevention feature.

With the exception of the cars purchased in 1921 all of the units have 26-in. wheels, insuring a comfortable step from the street level. Cars purchased in 1925 and 1926 and those now on order are of the same general design with the exception of twenty of the 1925 order, which were so designed as to make them easy of conversion to one-man operation. The popular type car in Atlanta is a 48-passenger, 46-ft. x 8-ft. car with 50-in. front door opening and 32-in. rear door opening. Electrical equipment consists of 35-hp. motors, K-75 low type control, line breakers and safety air brakes. The new interurban cars seat 52 passengers and weigh 37,800 lb. They are double-truck, four-motor units and have PC multiple-unit control for train operation and are equipped with Tomlinson couplers. The two-car trains have a seating capacity of 111.

This rolling stock serves a city system of 21 routes, thirteen of which are through routes. The remaining lines terminate in the downtown business district. In all, the Georgia Power Company operates 114 one-man cars, 239 two-man cars and 22 trailers in regular passenger service. It has a reserve of 26 single-truck cars, 24 double-truck open units for baseball and other special services, bringing the total to 425 units. This is exclusive of the 40 one-man cars now being constructed. Two interurban lines are operated, one to Stone Mountain, Ga., the

Digitized by Google

site of the gigantic Confederate memorial; the other, the Atlanta Northern Railway, runs to Marietta, Ga. There are 85.817 miles of double track and 49.919 miles of single track in Atlanta. The Stone Mountain single-track line is approximately 10 miles long with turnouts. On the line to Marietta there are slightly over 14 miles of single track and a mile of double track.

Service Improved by Faster Operation

Several measures for evaluating the service improvements in Atlanta are available. In 1923 the average speed in miles per hour was 9.18 as compared to 9.77 m.p.h. in 1926. There has been an increase in the average operating speed from 9.47 m.p.h. in 1923 to 10.5 m.p.h. in 1926. As a corollary to the increase in speed there has been a marked reduction in schedule failures. In 1926 the loss from schedule speed was 4.54 per cent as compared with 8.63 per cent in 1923. The following tabulation is of interest:

OPERATING SPEEDS IN MILES PER HOUR, GEORGIA POWER COMPANY

	1923	1924	1925	1926
Revenue operating speed	9.47	10.00	10.47	10.50
Schedule speed	9.28	9.54	9.78	9.81
Actual speed	9.18	9.45	9.73	9.77
Loss from schedule	0.10	0.09	0.05	0.04
Per cent of loss from schedule	8.63	9.45	5.12	4.54

Again, the effect of better and more up-to-date cars was a substantial increase in the total seat-miles and in the average seat-miles per car-mile.

SEAT-MILES OPERATED, GEORGIA POWER COMPANY

	Total	Per Car-Mile
1921	506,283,880	37.55
1922	501,245,891	37.50
1923	516,894,356	37.70
1924	527,855,915	38.30
1925	525,528,959	40.30
1926	573,757,570	43.33

Improved equipment in Atlanta brought about a large decrease in service interruptions resulting from pull-ins. The car-miles per pull-in in 1926 were 26,041, as against 3,002 in 1921, and the average number of daily pull-ins last year was 1.39, compared to 13.2 in 1921. An important factor in getting these results is a rigid inspection and overhauling program maintained by the equipment department. The criterion for overhauling is the life of the armature bearings. Cars with Westinghouse No. 68 and GE-67 motors are overhauled every 40,000 miles. Those with Westinghouse No. 101, 306, 307, 514 and GE-80 every 50,000 miles and units with Westinghouse 548, GE-201 and GE-265-A are overhauled every 60,000 miles. Overhauling is extended to controllers, line breakers, trolley bases, resistance cables, governors, door engines and circuit breakers, which are checked up and cleaned.

Little Rock Issues Time-table

WHILE the Little Rock, Ark., electric railway is primarily a street car system without long interurban connections, it has published a time-table of its various routes, grouping separately the weekday, Saturday and Sunday schedules, and giving as well the running times and time points. A sample of this time-table and reference to it are contained in the brief of the Arkansas Power & Light Company presented for the 1927 Coffin Prize. The schedule was issued on Feb. 15, 1927, and 25,000 were published. Distribution was made through operators and at cashier windows where street car tokens are sold.

Pictures of places of interest are shown in the booklet for the benefit of sightseers. They include the old State House, the new State Capitol, the Missouri Pacific station and the Memorial Bridge across the Arkansas River. The schedule has created much interest and has proved valuable to many patrons.

Unusual Acts to Improve Public Relations

DEVELOPMENT of ways for improving public relations and keeping in touch with public sentiment have been a feature of electric railway operation during the past decade. Various methods are now recognized as being of "the passenger be pleased" character. The brief of the El Paso Electric Company, El Paso, Tex., for the 1927 Coffin Prize shows that in addition to the standard ways it has developed a number of special methods of pleasing its patrons. A brief account of some of the more important of these follow:

The company's telephone operators are trained to answer inquiries intelligently and in a pleasing manner. Their training includes trips to all the company departments to acquaint them with those employees who use the telephones, how these departments function and the location of each branch phone. When a doubt exists as to the proper department to handle an incoming call, the operator determines this by a polite inquiry. When the right branch is not obtained at first, the employee who receives the call has it switched to the proper line.

If the company receives a complaint the investigation of which requires some time a special delivery letter is mailed acknowledging the receipt of the letter. This is later followed by a friendly visit to the individual making the complaint. Personal calls, in fact, are made in almost every instance regardless of the seriousness of the complaint, as this is found productive of the best results.

Last year on Christmas morning operators handed Christmas greeting cards to all passengers. The men took a genuine pleasure in doing this and awakened a similar feeling of good will toward them on the part of the public.

An inspection and information booth has been located in the heart of El Paso's downtown district. Last year the average number of inquiries made at it each day were about 400. Booklets are available here, as well as elsewhere, showing a map of the street car lines and bus lines, with the special feature that the house numbers in the different blocks are marked on all streets. This feature has attracted special popular favor because it supplies accurate information elsewhere not readily accessible.

Where a passenger drops too much money in the fare box, the operator is authorized immediately to refund the over-payment. Later he gets the money back from the division inspector.

Operators carry blanks called "Better Service Slips" on which they enter any comments they hear about the company and its service and forward them to the manager's office. Complimentary comments as well as those that are uncomplimentary are reported. They not only help the management to keep in touch with the opinions of the patrons but they are a powerful incentive to all employees to exert every effort to render the best possible service.

Paris Revises Street Railway and Bus Franchise

City makes changes in the method of calculating the bonuses for good management and economy of the local bus and street railway company

By Henry W. Blake
Senior Editor *Electric Railway Journal*

CHANGES have been made this year in the franchise under which the Société des Transports en Commun de la Région Parisienne operates the electric railway and bus lines in Paris. The authorities awarding the franchise were those of the Department of the Seine, in which Paris is located. The decree officially putting this franchise in force was issued on April 20, 1927. The changes from the previous franchise relate principally to the remuneration of the company for operating the system. The previous contract was dated Sept. 20, 1920, and was modified Feb. 7, 1925.

The theory on which the franchise, or leasing contract, is based is that the Department of the Seine is the owner of the property, having taken it over from the original proprietors, nine former operating companies. Their interest in it is being liquidated through annual payments by the department.

In the meantime the department has hired the S.T.C.R.P. to operate the property for a sum made up in part of interest on the investment which the S.T.C.R.P. has had to make and in part on a share in the earnings of the property. The company operates not only the bus and street railway lines in Paris and to some extent in the suburbs, but also a small steam suburban railway and a line of passenger boats on the Seine, engaged in local transit service. The steam railroad line and the boat line are not large portions of the company's business. It does not operate the rapid transit lines in Paris, those being

TABLE I—ANNUAL OPERATING REPORT OF S.T.C.R.P. FOR 1926 WITH RESULTS AFTER AMORTIZATION CHARGES

	Francs	Dollars
Passenger operating revenue (cars, buses and boats)	538,947,120	$21,557,885
Freight operating revenue	7,072,361	282,894
Miscellaneous operating revenue	5,905,008	236,200
Total operating revenue	551,924,491	$22,076,979
Operating expenses	552,245,542	22,089,821
Net revenue from operation (deficit)	321,052	$12,842
Fixed charges (including interest and amortization of purchase money and first cost)	81,854,031	3,274,161
Deficit of system	82,175,083	$3,287,003
Remuneration paid to company for operation	12,886,897	515,476
Deficit of department	95,061,980	$3,802,479

TABLE II—PROFIT AND LOSS STATEMENT FOR 1926 OF S.T.C.R.P.

	Francs
Balance from previous year	221,480
Interest at 6 per cent paid by department on capital stock	3,600,000
Operating bonus earned under contract	4,149,586
Economy bonus earned under contract	5,137,311
Miscellaneous receipts	251,397
Operating revenue	13,359,774
Corporate operating expenses and sinking fund payments of company	4,745,609
Gross income	8,614,165
Amount payable to department as its proportion of profits	1,376,390
Net income of company	7,237,775

These charts show population and other data of Paris and the Seine Department

The chart at the left gives the population in the Department of the Seine by decades. The one in the middle gives the same figures since 1861, divided between Paris itself and the districts in the department outside the city limits. It will be noticed that during the decade 1911 to 1921 the population growth has been entirely outside the city and this condition is expected to continue. By 1951 it is expected more people will live outside rather than inside the city. The chart at the right gives total passengers carried and rides per inhabitant for the Department of the Seine by years since 1889.

operated by entirely different interests under a different group of franchises.

Under the contract which has just been superseded the remuneration of the company was made up of three elements, as follows:

1. Six per cent on the capital stock of the company, which is guaranteed by the department.

2. A so-called "good management" bonus, amounting to $\frac{3}{4}$ per cent of the gross receipts.

3. A so-called "economy" bonus, which has consisted of 4 per cent of the amount by which the receipts exceeded 65 per cent of the expenses. In other words, if the receipts should be represented by R and the expenses by D, this remuneration normally would be represented by the formula $0.04\ (R - 0.65D)$. This bonus, however, was subject to a decrease on a graduated scale if it should exceed 0.85 per cent of the receipts. Moreover, when the earnings of the company should be sufficient to permit of the distribution of a dividend exceeding 8 per cent half of the excess amount had to be paid to the department. If the dividends exceeded 10 per cent three-quarters of the excess had to be paid to the department.

The department was also entitled to certain other deductions from the receipts for payments to its reserves.

Under the new franchise the payment of interest at 6 per cent on the company's stock is retained, but a new clause takes the place of those relating to the former good management and economy bonuses. There is only one bonus and it is 0.9 per cent of the ratio of the receipts to the expenses, multiplied by the receipts. That is to say, it may be represented by the formula $P = 0.009\ (R \div D)\ R$, where R represents the total receipts and D the operating expenses including taxes, plus certain other charges mentioned in the franchise.

This method of calculating the bonus, it will be seen, embodies the principles of both of the former bonuses, i.e., it encourages an increase of receipts, the former "good management" bonus, and also a low operating ratio, the former "economy" bonus.

The franchise strictly defines what shall and shall not

Digitized by Google

be considered operating expenses, and certain administration expenses, as well as certain corporate expenses not connected with operation, are not to be included.

Certain other payments, including those necessary to amortize within 30 years the company's capital stock of 60,000,000 fr., are made out of a separate allowance received from the department.

The bonus so earned is subject to deductions should it amount to 5,000,000 fr. a year. These deductions might be considered as a form of profit sharing with the department. The amount thus to be paid to the department is as follows: Twenty per cent of the bonus if it amounts in any one year to between 5,000,000 fr. and 8,000,000 fr.; 30 per cent if it is between 8,000,000 fr. and 10,000,000, and 40 per cent if it is more than 10,000,000 fr.

The bonus is also subject to a discount in any year in which there is a deficit from operation. This deduction is to be a percentage of the bonus already mentioned, $0.009\ R^2 \div D$, the percentage being calculated according to the formula $0.5\ (D - R) \div R$; in which D, as before, represents expenses and R represents receipts, D being greater than R, as this formula applies only when there is a deficit from operation. But this deduction from the bonus has a limit as it cannot be more than 20 per cent of the bonus otherwise earned. In other words, when there is a deficit, the bonus becomes $P^1 = P\ [1 - 0.5\ (D - R) \div R]$ except that P^1 can never be less than $0.80\ P$.

This provision does not affect in any way the deductions already mentioned where the bonus, however calculated, amounts to 5,000,000 fr. a year or more.

There are other changes to clauses in the contract, but it is believed that those mentioned are of the most general interest.

The employees continue to receive a bonus of 4 per cent of the gross receipts in addition to their wages, as formerly, but as this bonus is included in operating expenses, it does not affect the remuneration of the company.

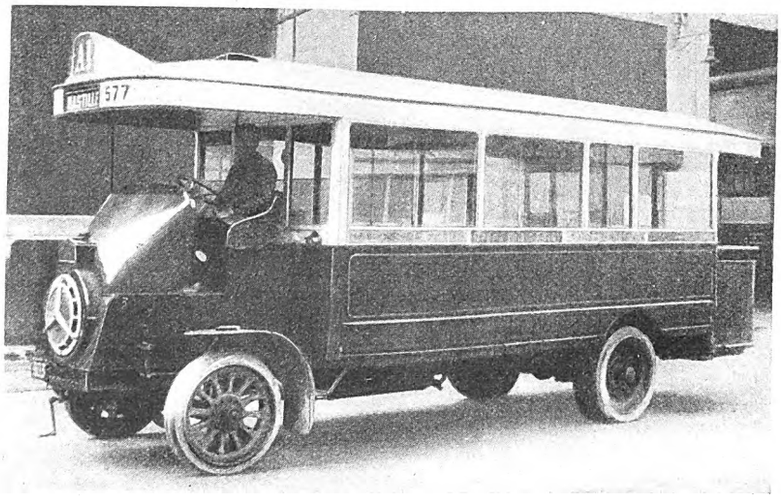
The operating report of the company for the calendar year of 1926 is shown in Table I. Compared with the 1925 figures, those for 1926 show an increase in total operating revenue of 110,002,240 fr., an increase in operating expenses of 82,024,968 fr., a reduction in the deficit from operation of 27,977,272 fr. and a reduction in the final deficit to the department of 35,439,289 fr. Part of this better showing was undoubtedly due to an increase in fare of about 25 per cent which went into effect in August, 1926.

The profit and loss statement of the company is given in Table II.

From this sum of 7,237,753 fr. for surplus for the year, after payment to reserves, directors' fees and the interest at 6 per cent mentioned above, a dividend of 4 per cent was declared on the capital stock. This dividend (with the 6 per cent interest already mentioned) made 10 per cent paid on the capital stock.

Some general statistics of the company's service are given in Tables III to V. In Table IV the low figure for the buses during 1917, 1918 and 1919 are due to the building up of the bus service during these years following its disorganization during the war. During 1911, 1912 and 1913 the bus receipts were from 37 to 50 per cent of the tramway receipts. On Aug. 2, 1914, all the Paris buses were requisitioned for military purposes and operation ceased. It was not until June 1, 1916, that the bus service began to be resumed and it was not until 1925 that full service recommenced.

The financial figures in these tables as well as the records on fare increases will hardly be understood unless the reader realizes the great increase in prices, measured in francs, which has taken place since 1914. Part of this, of course, is due to a fall in the exchange value of the franc, which in United States money was worth about 19¼ cents in 1914, but now has an exchange value of about 3.95 cents. It has been taken as 4 cents in all the accompanying tables. Table VI gives the various price index figures in France for general supplies and for the



Three steps in the evolution of the present Paris bus. Note the single rear exit and entrance in all of them and even in the horse car on page 1188

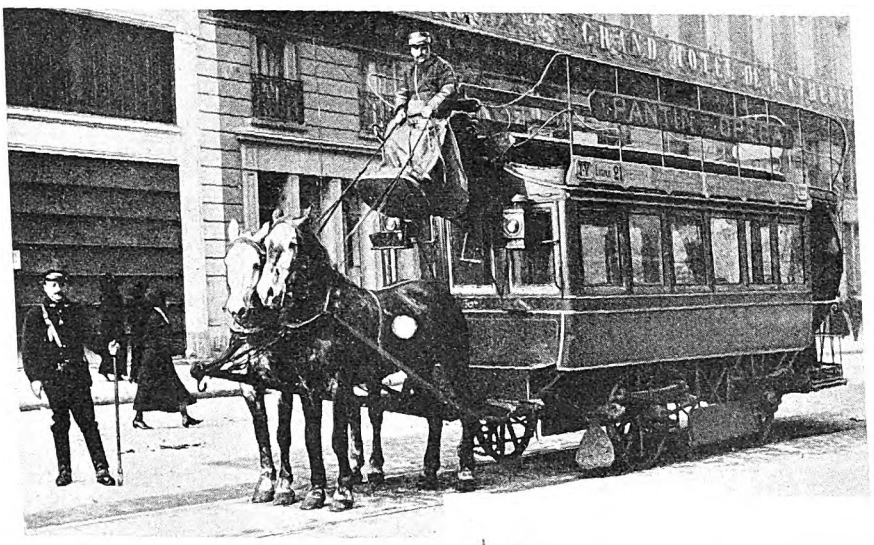
Digitized by Google

wages paid and other operating expenses as well as the fares of the Paris company.

Incidentally, it might be said that in 1926 labor accounted for 64.4 per cent of all the total operating expenses of the company, electrical energy for 7 per cent and fuel for the buses for 7.3 per cent.

For fuel the Paris buses now are using a mixture consisting of one-third gasoline, one-third alcohol and one-third petrol or kerosene. This mixture is used partly because of the high cost in France of gasoline and partly because, as alcohol is a French product, a tariff reduction is permitted on the other ingredients employed. At first the company had difficulty in keeping these three parts thoroughly mixed because of the difference in their specific gravities. This was finally overcome and the mixture now makes an acceptable fuel.

The charts on page 1186 giving population trends and data since 1831 as well as passengers carried and rides per inhabitant in the Department of the Seine since 1889 are from an analysis of traffic conditions in Paris, made in 1926 by A. Mariage, chairman of the board of the S.T.C.R.P.



In that study Mr. Mariage pointed out that the demand for transportation in Paris in recent years had grown much more rapidly than the transportation facilities. He urged the especial need of means for satisfactorily serving the suburbs, which are increasing in population rapidly, while the population in the center of the city is about stationary.

His recommendations include preparation by the city of a comprehensive city development and transportation plan under which part of the cost of financing the necessary transportation facilities would be borne by the territories directly benefited. The transportation system, in his opinion, should include rapid transit radial service and means for local distribution, all under one management.

Physical Equipment and History of Present Company

On Dec. 31, 1926, the rolling stock of the S.T.C.R.P., the company which operates all of the buses and street railways in Paris, consisted of the following:

Electric tramways—2,291 motor cars, 892 trail cars.

One suburban steam tramway—Nineteen locomotives, 75 passenger cars, 134 freight or baggage cars, two gasoline rail cars.

Motor buses—1,268 four-wheel buses, including one trackless trolley; 51 six-wheel motor buses, 30 express type buses, 22 auto cars.

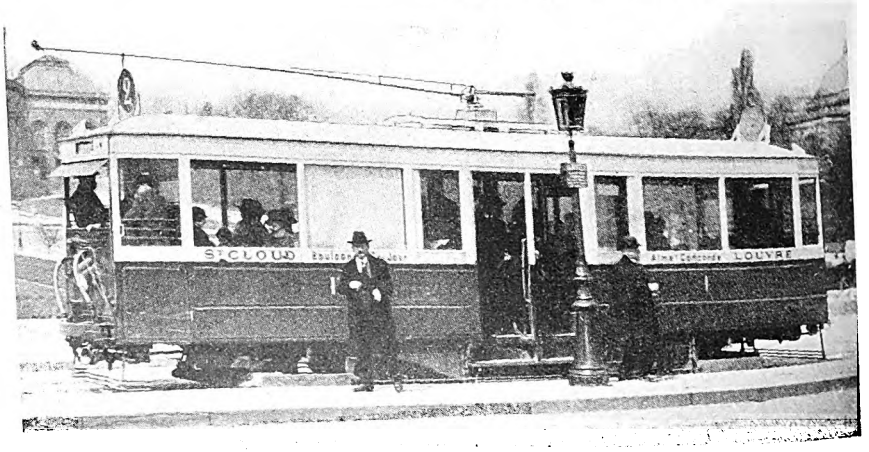
Boats—56 passenger steamers, two tugs, 68 tow boats.

The present company is the successor in handling street railway and bus traffic of nine older companies, namely: Compagnie Générale des Omnibus de Paris, Compagnie des Tramways des Paris et du Département de la Seine, Compagnie Générale Parisienne de Tramways, Compagnie des Tramways de l'Est Parisien, Compagnie des Chemins de fer Nogentais, Compagnie Electrique des Tramways de la Rive gauche de Paris, Compagnie du Chemin de fer du Bois de Boulogne, Compagnie du Chemins de fer sur route de Paris à Arpajon, Compagnie des tramways de l'Oust Parisien. Of these the first named, the Compagnie Générale des Omnibus, was the pioneer.

Omnibus Transportation in Paris Since 1828

According to the records, the first regular omnibus company organized to give local transportation in Paris was chartered in 1828. The rate of fare at first was 25 centimes, raised later to 30 centimes, and a number of omnibuses were put in service. At first they were rather scorned by the bourgeoisie, but they soon gained popularity. By 1854 and 1855 there were no less than twelve companies operating street lines and employing 3,925 horses. Various models of buses were used. The names of some of these early companies, translated into English, were General Omnibus Company, the Favorite, the Citizens, the Gazelle, the Parisian, the Classical and the Excellent.

In 1855 all of these companies were consolidated, under the name of Compagnie Générale des Omnibus (General Omnibus Company). This company received from the municipality a 50-year franchise for the exclusive right in Paris of transporting passengers and occupying the public streets for vehicles engaged in such service. Later, the life of its franchise was extended.



The horse car of 30 years ago and the modern electric car. Upper decks for passengers have been abandoned in Paris for both cars and buses

TABLE VI—PRICE INDEX INCREASES COMPARISON, 1914 PRIOR TO THE WAR WITH DECEMBER, 1926
(Based on 100 in 1914)

Industrial Index Figures:	
Manufactured supplies	802.0
Minerals and metals	820.0
Coal	635.0
Electrical energy	454.0
Labor:	
Wages paid by the S.T.C.R.P.	700.7
Expenses and Fares of S.T.C.R.P.:	
Bus operating expenses	453.0
Electric railway operating expenses	528.0
Total operating expenses	500.0
Fares	450.0

Note.—All prices are computed in French francs.

Some of the early types of omnibuses used in Paris are illustrated. While they differ greatly from the present buses in design, as well as in motive power, some of the features of the early buses have been retained in those which operate over the Paris streets of today. Noticeable among these features is the single entrance and exit in the rear of the bus. The Paris management believes this place for entrance and exit is safer than at the side. Its latest electric railway cars, however, have a center entrance only.

Tramway Development

Although some tramway track was built in Paris in the '60s, street railway construction on a large scale was not begun until after the war of 1870, when several lines were built by the General Omnibus Company. Later, with the assent of this company, other companies built short sections of tramways.

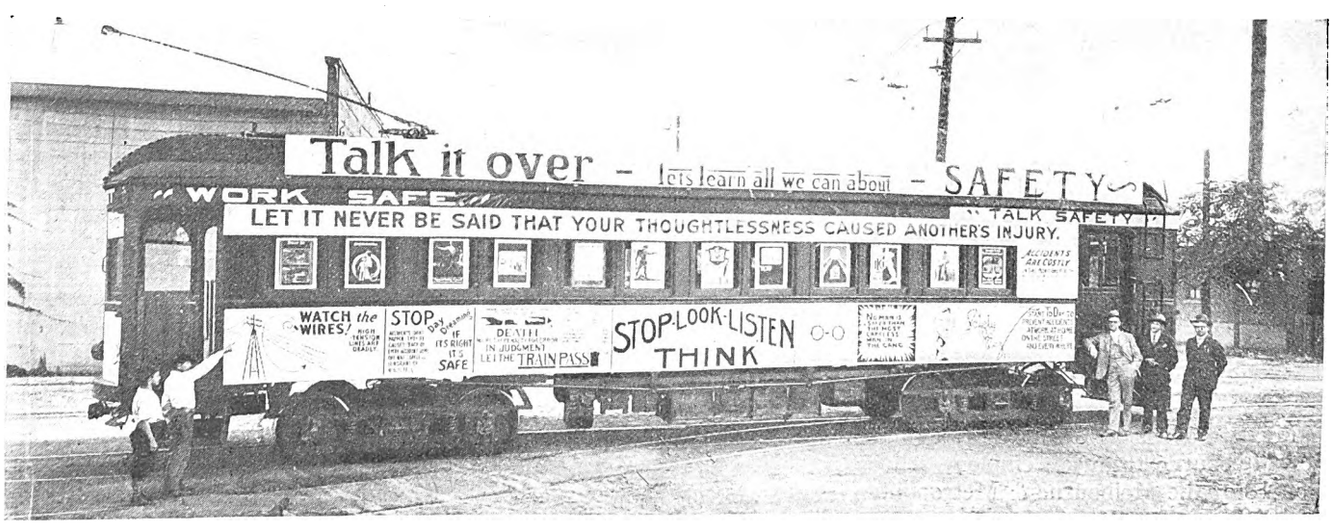
As will be seen from Table IV, the street railways carry about twice the number of passengers and operate about twice as many car-miles as the omnibuses. Several street railway lines have stub terminals close to the center of the business district, as at the Madelaine, Opera, Louvre and Place de la Concorde, but in the district within these points, and bounded on the northeast by the Boulevard de Sebastopol, there are no street railway lines. This restricted area is about 1 mile long and from ¾ to 1 mile wide. There is no definite policy on the part of the city authorities to expand this area of purely bus operation, though in the last few years the company has removed about 2 miles of electric railway track north of the Seine and 2 miles south of the Seine in very dense traffic sections at the request of the police department.

The street railways in the center of the city use the underground conduit and outside of the center the trolley. The underground conduit originally built in Paris was constructed under one rail, so that the slot for the conduit served also as the groove for the rail. This system had various drawbacks, especially as to switches, and all recent conduit construction has been of the center slot type.

Safety Car Brings Vital Message to Interstate Public Service Patrons

SAFETY has been made a big factor in the successful operation of the Interstate Public Service Company, Indianapolis, Ind. James Harmon, safety manager, recently chose the most dangerous time of the year to impress the company's patrons that they must be on their guard against accident. This was at the opening of the school year, when the "Safety Car" pictured left Indianapolis to visit most of the cities and towns along the line between Indianapolis and Louisville. The interior of the car was placarded with safety bulletins and shop bulletins. There was also a display of safe and unsafe articles and appliances. Safety pamphlets were distributed to the public and the prone-pressure method of resuscitation was demonstrated. Safety talks were also made before several groups.

School children received a special invitation to view the car and it is estimated that more than 5,000 men, women and children inspected it.



This car was sponsored by the Interstate Public Service Company, Indianapolis, Ind. It told its story from the capital of Indiana to Louisville, Ky.

Australian Pension Plans Discussed

Melbourne study shows that pensions cannot be paid out of fares alone. Deferring payments is a dangerous expedient

SOME striking facts regarding the cost of a superannuation fund for tramway employees similar to those already enacted for other Victorian employees or in force in other Australian states were given in connection with evidence to be presented to the state parliamentary accounts committee by W. O. Strangward, secretary Melbourne and Metropolitan Tramways Board during 1927. An abstract of his notes follows:

The New South Wales superannuation act of 1916 calls for the compulsory participation of railway and tramway employees in funds covering the retirement of men at 60 years and of women at 55 to 60 years. The pensions range from £52 ($253) to £312 ($1,516) a year.

The employee's contribution to a pension of £2 ($9.72) a week for himself and less for his widow and children ranges from 2s. 4d. (58 cents) for male employees aged 16 to about 5½ times that amount for male employees aged 60. Contributions and benefits in the case of women are considerably lower.

The act provided that in respect to future employees the state would pay as much as the employee. However, the then employees were to pay no more than the "age of 30" rate. This was to be matched by the state plus the shortage between the "age of 30" rate and the employee's actual age for pensions up to £104 ($505). So far, the New South Wales government had fallen short of its share by £2,000,000 to £3,000,000 and was planning operations whereby these arrears could be refunded over a long period of years.

The Victorian superannuation act of 1925 is similar to that of New South Wales, but the retirement ages are five years greater, which substantially reduces the cost. To get £2 ($9.72) a week for himself or less for his family, an employee pays from 2s. 1½d. (about 52 cents) a week at the minimum age of 16 up to about twenty times that amount if aged 65. Another important difference is that the state's contribution is not made to match the employee's weekly payments but is given in the form of an amount ranging from 50 to 98 per cent of the pension when it becomes payable, so that the main burden is pushed off to later years. The commonwealth superannuation act of 1922-24 is similar to the Victorian except that the maximum pension is £416 ($2,022) instead of £312 ($1,516).

Mr. Strangward pointed out the ethical injustice of the Commonwealth and Victorian plans, because pensions are really deferred wages which should not be saddled upon the next generation. In Victoria, however, the extenuating circumstances are stronger for certain historical reasons in connection with earlier pension funds.

What Pensions Would Mean to Melbourne Tramway Finance

Mr. Strangward then took up the matter of a pension for Melbourne tramway employees in accord with section 18 of the Melbourne & Metropolitan Tramways act of 1918. He felt that the board was not likely to approve any scheme based upon a postponement of present actuarial liabilities. The revenue of the governments was raised by taxation, but that of the tramways came out of fares. A further increase in fares would cause many passengers to find other means of transport, and in all probability, higher fares would not produce more revenue. Apparently, this left the imposition of a special tax on the community at large as the way to provide a superannuation fund. For this reason, the board would probably incline to the view that it must provide for all accruing liabilities out of each current year's revenue.

Pending actuarial study, and excluding about 1,000 temporary employees, Mr. Strangward submitted the following table:

	Number	Average Age	Weekly Payment*	Average Earnings*
Staff	720	40	8s. 5d. —$2.10	£312—$1,516
Traffic	3,500	36	5s. 6½d. — 1.37	255— 1,239
Shops	820	38	6s. 1½d. — 1.52	260— 1,264
Construction	100	38	6s. 1½d. — 1.52	245— 1,191
	5,140			

* At $4.86 to the pound sterling.

Based upon the principles of the Victorian act of 1925 with 65-year retirement age, the employees would contribute £80,837 and the board an equal amount, giving a total of £161,674. However, if employees in the £104 a year pension maximum class paid at the "age of 30" rate and the staff or office employees in the £130 a year class paid at the "age of 40" rate, the weekly contributions would be only 5s. 10d. (approximately $1.45) for office employees and 4s. 2½d. (approximately $1.05) for the others. This would cut the employee's share to £59,282 and raise the board's contribution to £102,392.

If the 60-year age of New South Wales were used, the employee's half in the first calculation would be £221,468 a year; and in the second or fixed-age contribution scheme, £77,235, with £144,233 a year to come from the board. The cost of the scheme would be slightly reduced through lower costs and obligations for women but would be higher than estimated, since many employees would be under 30 years of age.

Existing Scheme of Retirement Allowances

In 1923, the board made this provision: An employee of at least ten years' service who retires at the age of 60 years, or the widow or children under 16 years of age of an employee of such service who dies after reaching 55 years, receives a lump-sum gratuity from the board based upon two weeks wages for each year of service since July 1, 1910, with a maximum equivalent to 39 weeks' salary or wages. This is a voluntary allowance, and employees do not contribute to its cost. It averages about £5,000 per annum.

Mr. Strangward also called attention to the commonwealth invalid and old age pension acts which grant a pension of £1 ($4.86) a week to employees who have reached the age of 60 if permanently incapacitated or else those who have reached 65. The employee makes no direct contribution to this fund. Accident and illness cases are also under this fund. Receipt of a tramway pension of £104 a year would debar unmarried persons from the £52 a year of the commonwealth pension. However, if a husband and wife are each entitled to claim old-age pensions, the receipt of the £104 tramway pension (if such be their sole income) would operate to reduce their old-age pensions to 12s. 6d. (about $3.10) a week each. This means that tramway employees who may become qualified to obtain the commonwealth pension would in many cases obtain no increase in their total incomes because they had participated in the suggested tramway superannuation fund.

Illinois Central Has Steadily Improved Its Suburban Service*

By W. M. Vandersluis
Electrical Engineer Illinois Central Railroad, Chicago, Ill.

EXACTLY 70 years after the first steam suburban service was started in Chicago by the Illinois Central Railroad three electric trains were operated each way in the local service between Randolph Street and Hyde Park. Beginning with the second week 80 trains were operated each day and in the period of about five weeks the electric service was built up to more. than 350 trains. These were all operated, of course, on the existing steam time-table, as there was still a considerable number of steam trains in the service.

The first electric time-table was put in effect on Aug. 28, with a total of 396 revenue trains. On account of a shortage of new equipment it was still necessary to run six trains by steam, but these were confined, so far as possible, to those carrying shop employees.

Today 470 revenue trains are being operated on a normal weekday. In addition there are fourteen equipment trains and 72 Chicago, South Shore & South Bend trains, the latter being operated between Kensington and Randolph Street. This is a total of 556 electric trains. Electric service was put in effect with no serious accidents or interruptions and has continued so during the first year. Because all of the motor-trailer car units are uniform in design and in operating characteristics, the preparation of time-tables and the handling of equipment at terminal points has been greatly simplified.

Fig. 1 shows by months the revenue passengers carried, the car-miles and hundreds of seat-miles operated and the weekday trains in service.

Improved Service With Electric Operation Due to Higher Speed and Reliability

Of particular interest is the improvement in running times due to electric operation. The latest electric time-table shows decreases in running times over the old steam service of from 11 to 28 per cent for the various classes of trains, the larger percentages resulting for trains to Kensington and beyond. The decrease in over-all time results from high maximum speeds and by the use of high accelerating and braking rates. Acceleration is at the rate of $1\frac{1}{2}$ m.p.h.p.s., which is about six times as rapid as that of through passenger steam trains. Under normal operation a train will reach a speed of 28 m.p.h. in twenty seconds. After that point the rate of acceleration falls off, but on level tangent track a train will reach a speed of 50 m.p.h. in two minutes. With present average voltage conditions, balancing speed is about 64 m.p.h. Comparatively high braking rates have been effected on the steam trains, but these also have been increased on the electric trains, which brake at the rate of $1\frac{3}{4}$ m.p.h.p.s. It is significant that large

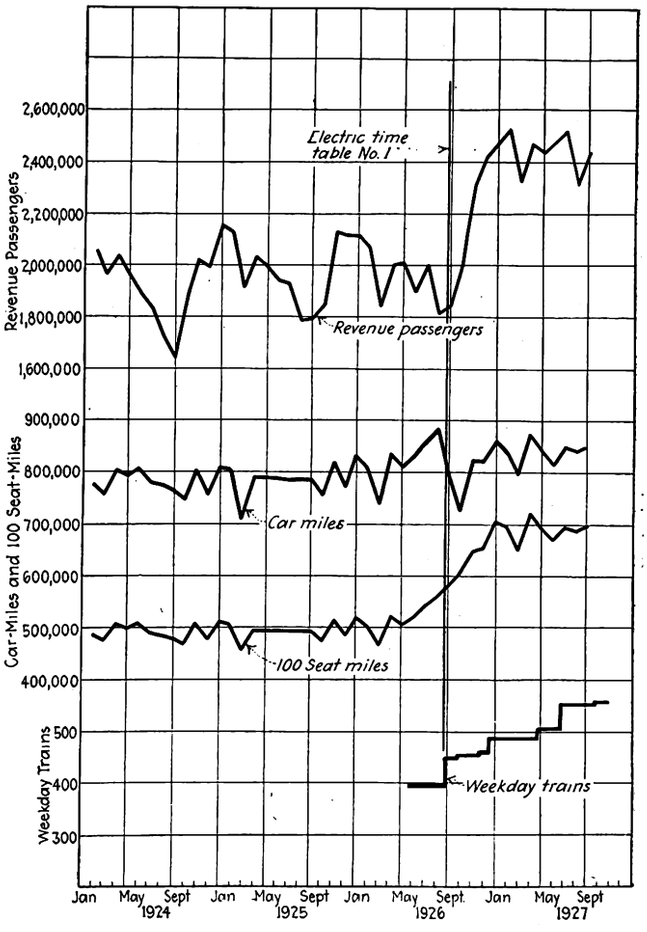

Fig. 1—Operating curves before and after starting electric operation on Illinois Central Railroad

decreases have been made in running times even on runs where more stops are made than formerly.

There has been a large gain in the use of electricity as compared with steam from the standpoint of operating a congested terminal. This improvement will become of greater importance as the service grows, inasmuch as with steam the limit to the number of trains physically possible to move in or out of the Randolph Street terminal was rapidly being approached. It is readily apparent that this gain is made by the elimination of movements necessary for steam engines in changing ends of trains, and also in being brought from and taken to the engine terminal, since these movements must be made over the tracks serving useful train movements. The electric train requires only the normal loaded movements over these busy sections, except when brought from or taken to storage tracks at the beginning or end of rush hours.

**Abstract of a paper presented at the regional meeting of the Great Lakes Section, A.I.E.E., Chicago, Ill., Nov. 28-30, 1927.*

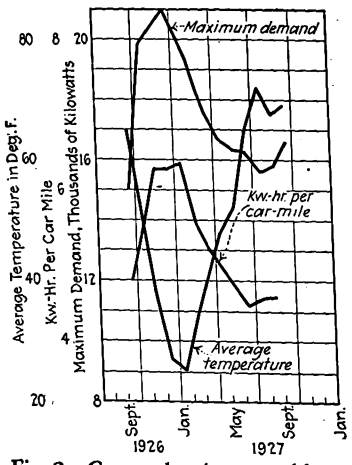

Fig. 2—Curves showing monthly averages of temperature and kilowatt-hours per car-mile and monthly maximum demand

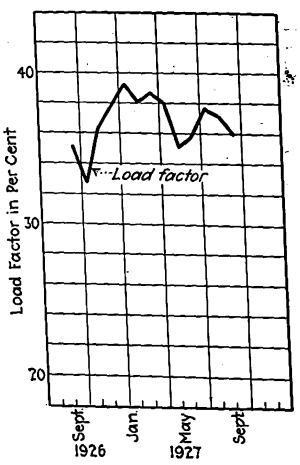

Fig. 3—The load factor curve shows a considerable variation over the twelve-month period

The speed and reliability of electric service have been further enhanced by other improvements of the entire terminal. These include changes in the grades, rearrangement of tracks, elimination of railroad grade crossings, installation of high platforms at all suburban stations, additional interlocking plants and rebuilding the entire automatic block system to conform to electric traction requirements, a great part of which had been completed at the time of beginning electric operation.

Results obtained from the motor-trailer combination have been satisfactory to the operating officers. The elimination of all steps on the cars for regular operation and constructing high platforms, the use of sliding doors, fully inclosed vestibules, tight lock couplers, automatic acceleration and electro-pneumatic braking have made the service safer, speedier and more convenient.

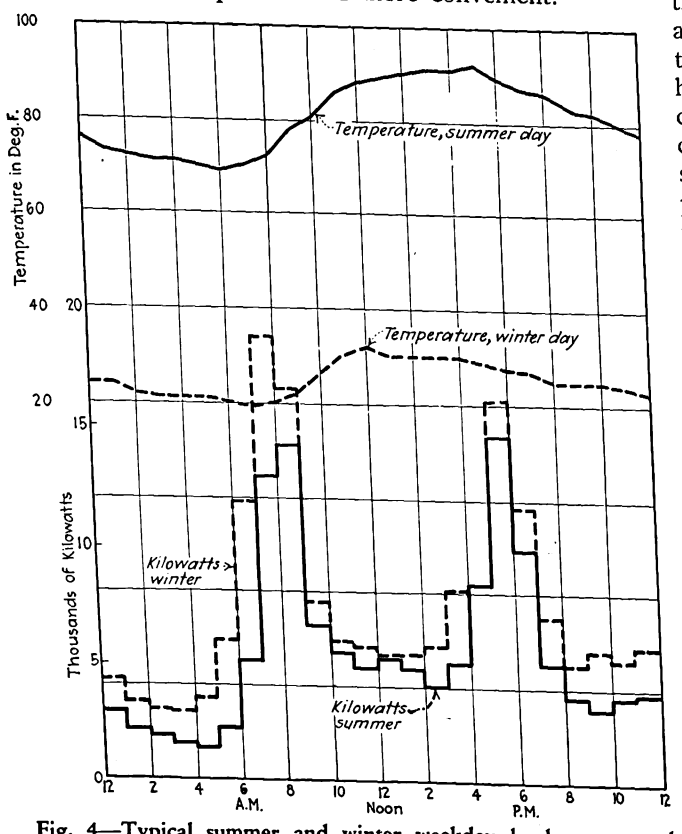

Fig. 4—Typical summer and winter weekday load curves and temperatures. Full lines are for the summer day, the dashed lines for the winter day

The employment of aluminum or aluminum alloys in side and roof sheets, doors, conduit and fittings has materially reduced the weight of the cars and, thereby, the operating expense. The weight of the motor car is 70.65 tons and the trailer 44.27 tons, an average weight per car of 57.46 tons. For the year ended Sept. 1, 1927, the average cost of maintaining the cars was about 6 cents per car-mile. Delays due to electrical equipment have been very few and no radical changes in design have been found necessary. Minor changes incident to new designs have been made, but at very slight expense.

Operating Figures Vary Considerably

Fig. 2 shows the kilowatt-hours per car-mile and the maximum demand in kilowatts, with corresponding average temperatures. Electric heating of cars is, of course, largely responsible for the variation between the different months, but changes in time-table also affect it slightly.

For the year ended Sept. 1, 1927, the total energy supplied under the contract with the Commonwealth Edison Company was 57,274,512 kw.-hr. Of this total, 92.7 per cent was for traction purposes, including heating of cars; 6.1 per cent for light and power and 1.2 per cent for signals. The contract also provided that the railroad company guarantee a 30 per cent load factor. It will be noted in Fig. 3, showing the variation in the load factor, that it is well above the guarantee. Load curves for typical summer and winter weekdays are shown in Fig. 4.

The supply of energy by the power company in specified feeders to the right-of-way line of the railroad company from the seven substations has been looked upon in some quarters with misgiving. This requires that not only the conversion machinery but all protective apparatus in the railroad company's feeders be maintained by the power company. The railroad company, however, has taken over, under normal operation, the control of all traction feeders by use of its supervisory control system. So far the results obtained have been satisfactory with the power company's broad-minded policy in operating under the necessarily somewhat complicated agreement.

Breakers Have Functioned Well

Discrimination of the high-speed circuit breakers has been excellent. The overhead network on a multiple track railroad such as this installation covers is complex due to the necessity of having a minimum amount of track out of service, in case of a fault. Isolation of individual sections in case of trouble has come up to expectations with very good protection to line and equipment. Furthermore, the power supervisor controlling the traction feeders has immediate information as to opening of breakers. He is located in the office of the train dispatcher, so that, by working close together, trouble from a train going from a live to a grounded dead section has been minimized. The use of wayside signals indicating a dead trolley section at points where the sectioning is outside the limits of interlocking plants has also saved burn-outs of overhead.

The cold weather of the first winter indicated that a few minor changes, especially in pull-offs, were desirable. The delays which have occurred, however, have been small considering the size of the installation and the number of trains operated.

The new cars are comfortable and attractive. They replaced antiquated equipment that repelled riders

Revenue Doubled

by Modernization of Porto Rico Railway

New cars have been bought, some old cars have been remodeled and track has been rebuilt. Polarity of electric distribution has been reversed

By Frederick Krug
General Manager Porto Rico Railway, Light & Power Company, San Juan, P. R.

IMMEDIATE increase of 30 per cent in the number of passengers carried and the doubling of its passenger revenue in a period of one year have been the result of improvements introduced on the street railway system of the Porto Rico Railway, Light & Power Company, San Juan, P. R. Four factors have contributed to the attainment of this result: First, the purchase of six new steel cars, modern in every respect and specially designed for tropical service, and the complete rehabilitation of the best five of 35 old cars; second, extensive overhauling and improvements to track and roadbed; third, speedier and more reliable service by the substitution of a loop operation for the former single-track service with turnouts and delays in the residential district, and, fourth, advertising and publicity.

Staggering along some years ago with antiquated equipment, with maintenance deferred on its track and with practically unlimited competition by jitneys and

The city of San Juan is on the island in the foreground. On the mainland behind are two important suburbs

Digitized by Google

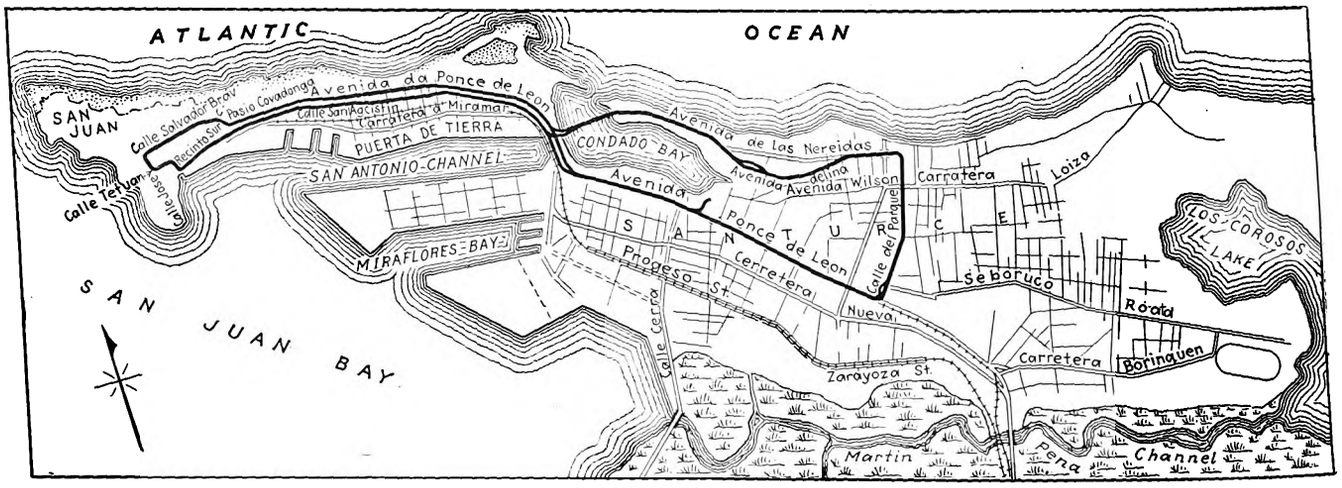
buses, the situation of the trolley system went from bad to worse, until finally, early in 1926, the losses reached such a magnitude that some drastic action was necessary. The company had been trying for more than seven years to secure a franchise to extend its double track from the city of San Juan through the main residential district of Santurce, but without success. It was impossible to give an adequate service in a city of the size of San Juan with a single-track system. Abandonment was considered as a means of bringing the matter to a head, but this proposal was not acceptable to the Public Service Commission except under conditions with which the company was unwilling to comply. The population of San Juan and environs is approaching 100,000 and the city is growing rapidly. It was felt that no city of this size could be adequately served by buses alone and that the street car would sooner or later come into its own again as a vital factor in the transportation situation.

Accordingly plans were made to rehabilitate the system in an endeavor to meet operating expenses pending the possible construction of a double-track system later and the growth of the city to the point where the street railway again became indispensable. An order was placed for six new light-weight, steel, four-motor, single-end cars, with a seating capacity of 57 and a total weight of only 30,000 lb. These six cars were placed in service last spring and have been running for eighteen hours a day since their arrival. With their bright and cheerful coloring of yellow and white, contrasted to the barn red on the old cars, the new cars met with instant public favor. The leather-upholstered seats in place of wooden seats on the old cars, their practically noiseless operation and the cheerful interiors all contributed to their immediate success. An innovation for Porto Rico on these cars is the front-entrance and center-exit arrangement. The conductor is stationed at the center doors and fares are collected on the pay-as-you-pass system. This has increased the seating capacity and made feasible observation seats on the rear of the car. These seats have proved to be very popular.

Five of the best of the old cars were completely remodeled and painted to conform to the color scheme on the new cars. Leather-upholstered seats were installed and the trucks and bodies were revamped to secure quiet operation. These cars have been helpful in securing the increase in patronage, but it is felt that it would be inadvisable to overhaul any more of them. It is planned rather to buy new ones as the increase in riding requires.

The work of reconstructing the track and roadbed was started a year ago and has not yet been completed. This has involved considerably more expense than was originally anticipated. Nevertheless the work has been carried out in a thorough manner because the company has confidence in the future of the street railway. Fortunately, a considerable portion of the track is T-rail, open on a private right-of-way and paved only at street crossings. Work on this track was completed rapidly. Defective sections of rail were replaced with new rail and all poor ties replaced with hardwood ties purchased in Santo Domingo and in the local market. Badly cupped rail ends were cut off and joints made smooth by building up low spots with the electric welder. A considerable amount of ballast was also added, which has helped to promote smooth riding.

Track in the old city of San Juan is paved. This section is at considerable distance from the power house and it was found that, due to the poor track bonding with which the system had been operating for many years, the bases of most of the girder rails had been eaten away by electrolytic action. This has necessitated tearing up much pavement for replacement of rails and considerable expense has been entailed thereby.

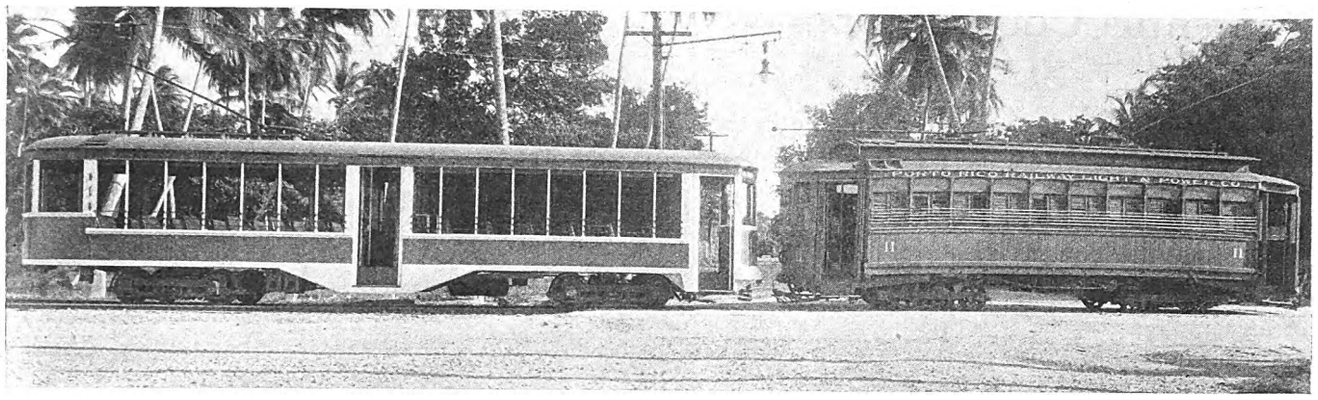


Double track is used in San Juan. In the suburbs at the right is a single-track loop, on which the direction of traffic is reversed several times a day

In order to put a stop to this corrosion of the rail on the most expensive part of the roadbed, in addition to improving the bonding, it was thought advisable to reverse the polarity on the system, thus reversing the current flow at the rails. Furthermore, grounds were installed at four points on the system from the rail to the salt water which completely surrounds the city. A good ground consisting of several large steel boiler shells was installed at the power house. It is believed that the reversal of the polarity (negative on trolley, positive on rail), combined with salt water grounds and improvements in the bonding, will keep down rail corrosion and result in a considerable saving in power and better voltage at the motors with a resultant saving in motor maintenance.

The most difficult problem of all was to find a substitute for the single-track service that had been given in the suburbs of Santurce and the Condado for years. San Juan stands on an island almost 3 miles long. The suburbs of Santurce and the Condado, on the mainland,

Digitized by Google



Comparison of the new and the old. The change has enabled the revenue to be doubled

are reached by several bridges, but are divided from each other by a bay of some extent. In the city of San Juan the system is double track, but at the bridges one track goes out through Santurce on the main highway and the other through the Condado, the two joining to form a loop about 2 miles further out. This situation is shown on an accompanying map.

The Condado section is thinly populated, mostly by people of large means who use private automobiles almost entirely. Santurce, on the other hand, is densely peopled with potential street car riders who at the time these improvements were inaugurated used the buses almost exclusively. The idea was conceived of giving a loop service in the suburban territory by running the cars in the direction demanded by the majority. This was found to require five reversals daily on the loop. Since practically all of the traffic is into and out of the business district of San Juan a schedule was worked out, after careful study, by which all cars go into San Juan through the Santurce section in the morning until 10:30. At that hour the service is reversed in the loop to bring people out of San Juan directly into the Santurce section. Similar reversals are made at 12:30 p.m., 3 p.m., 7 p.m. and 9:30 p.m. By experience it has been found that these are the hours at which the demand for transportation reverses. The result of this schedule has been that the average speed of cars, including stops, has been increased from 7 m.p.h. with the old two-way service to 10 m.p.h. with the loop service, and this in spite of the growing traffic congestion in the city of San Juan.

Considerable time and energy have been devoted to popularizing street car riding by advertising freely in the local papers. A slogan was adopted that has become well known locally, Rapidez, Seguridad y Cortesía, which translated reads Speed, Safety and Courtesy. The company has endeavored by every means in its power to live up to these precepts. That the trolley offers the safest transportation in San Juan and that its staff is unusually courteous is now well recognized throughout the city, and that, because of the advantage of considerable private right-of-way the street car can generally make better time than other vehicles in the rapidly growing congestion of the city, the street car is daily gaining in patronage.

California Commission's Work

SEVENTEEN appraisals of properties of public utilities were engaged in by the valuation division of the engineering department of the California Railroad Commission during the fiscal year ended June 30, 1927, under seven condemnation, eight rate and two securing issue proceedings. Properties of five different types of utilities, located in various parts of the state, were included in these investigations. Property valued at many millions of dollars, easily in excess of $100,000,000, is included in the valuation work of this division, the figures themselves not being available at this time. Among the railways were the Key System Transit Company, Stockton Electric Railway, Los Angeles Railway, Pacific Electric Railway and the San Jose Railroad.

Apprentice Course Works Well in St. Louis

Four-year course, with concurrent training in trade school, attracts young men to railway shops. The majority stay with company after graduation

FOR the past eleven years, except during 1917 and 1918, the United Railways of St. Louis has been conducting an apprenticeship course in its shops, divided into electrical work, machine shop work, car building and car painting. Previous to 1916 the company used each year to engage a number of boys between the ages of sixteen and eighteen years for its shops, but as it had no plan of training them in the various branches of the work they did not remain long in its service. Particulars of the existing plan are given in the company's brief for the 1927 Coffin Prize.

Fortunately for the success of the present course, the St. Louis shops are near the David Ranken School of Mechanical Trades, a trade school with a high reputation in St. Louis. In planning its apprenticeship course, the company decided to offer to send its shop apprentices to this school if they would agree to take the company's apprenticeship term of four years. At this school the boys attend the night courses. Every apprentice must take at least two nights per week at the school, but has the privilege of attending four nights if he desires to do so. The courses taken by them include mathematics, drafting and applied science, and their tuition bills are paid by the United Railways.

The apprenticeship course under these conditions was started in 1916 with a maximum enrollment of 20 boys, divided in the electrical repair shop, machine shop, car building shop and paint shop. The rate of pay at that time was 12 cents per hour for the first six months of continuous service, with an increase of 1½ cents per hour at the beginning of each six-months period. This brought the rate for the eighth or final period to 22½ cents per hour. This rate necessarily has had to be increased under the present changed conditions.

In each department of the shops the boy starts in with the simplest work and gradually acquires experience in all branches of his trade. For instance, in the machine shop an apprentice is put on the drill press for the first six months. During the next 3½ years he is advanced from machine to machine until he has had experience in every kind of shop work in that department. In the other departments apprentices are likewise started with the simpler duties and moved higher as the course continues.

The only time that there has been any interruption to this system of apprentice training was during the war years of 1917 and 1918, when a number of the boys who had had one or two years training left. With the experience they had acquired they found it possible to obtain better paying positions in manufacturing plants in St. Louis. In 1919, after this artificial spurt in manufacturing was over, the company was able to go on with its course in the regular way.

Since the plan was begun in 1916, and up to June 1, 1927, nineteen apprentices had completed the four-year course. Of this number fifteen are still in the service of the company. At present 22 apprentices are taking the course. Of this number, six are in the armature room, four in the machine shop and twelve in the carpenter shop.

The company's experience has been that an apprenticeship course of this kind is entirely practical and beneficial both for the boy and the company in maintaining the necessary quota of skilled mechanics. The schedule followed is given in the accompanying table.

SCHEDULE OF WORK FOR APPRENTICES

Machine Shop:
First and second periods, drill press and bolt cutter.
Third and fourth periods, drill press and shaper.
Fifth and sixth periods, milling machine and lathe.
Seventh and eighth periods, planer and lathe.

Paint Shop:
First and second periods, rough work, cleaning, priming and surfacing.
Third and fourth periods, coating and brush-work.
Fifth and to eighth periods, brush and pencil work, striping and lettering.

Armature Room:
First period, sleeving and tieing coils.
Second period, winding coils.
Third period, taping coils.
Fourth period, taping fields.
Fifth period, winding fields.
Sixth period, repairing controllers.
Seventh period, stripping armatures.
Eighth period, winding armatures.

Carpenter Shop:
First period, stripping cars.
Second period, floors and framing.
Third period, car hanging.
Fourth period, car framing.
Fifth period, roof and side panels.
Sixth period, vestibules.
Seventh period, fitting sash and doors.
Eighth period, ceiling and trimmings.

After an apprentice has finished his course of four years work in the company's shop and has received the proper rating from the Ranken Trade School he is given a certificate of graduation by the company. His pay is then increased 22 cents per hour and he is retained in the service of the department in which he has been trained. Here his duties and rate of pay are comparable to the men in that department classed as journeymen.

Street Railway Operation of Buses in Germany

RECENT statistics compiled by the German Street Railway Association show that the 77 members of the association operate 1,064 buses and that four of these operate a total of 39 bus trailers. In the table compiled by the association the operating roads were grouped in four classes, as shown in the accompanying table. In the first group Hamburg leads with 58 buses and Dresden has 55. The third group covers small railroad lines outside of the German State Railway System and the fourth the Berlin General Omnibus Company. This road is classed by itself because it is controlled by the city of Berlin, which also owns the street railway system. Hence it is operated in non-competitive service with the Berlin street railway.

STATISTICS OF BUSES OPERATED BY MEMBERS OF GERMAN STREET RAILWAY ASSOCIATION

No. of Cos.	Type of Company	Number of Vehicles Buses	Number of Vehicles Trailers	Length of Line—Kilometers	Length of Line—Miles
60	Street railways	546	39	2,161	1,351
10	Interurban railways	41	..	655	409
6	Private railway lines	46	..	496	310
1	Berlin Omnibus Company	431	..	307	192

Maintenance Methods and Devices

Grease Lubrication for Brake Hangers

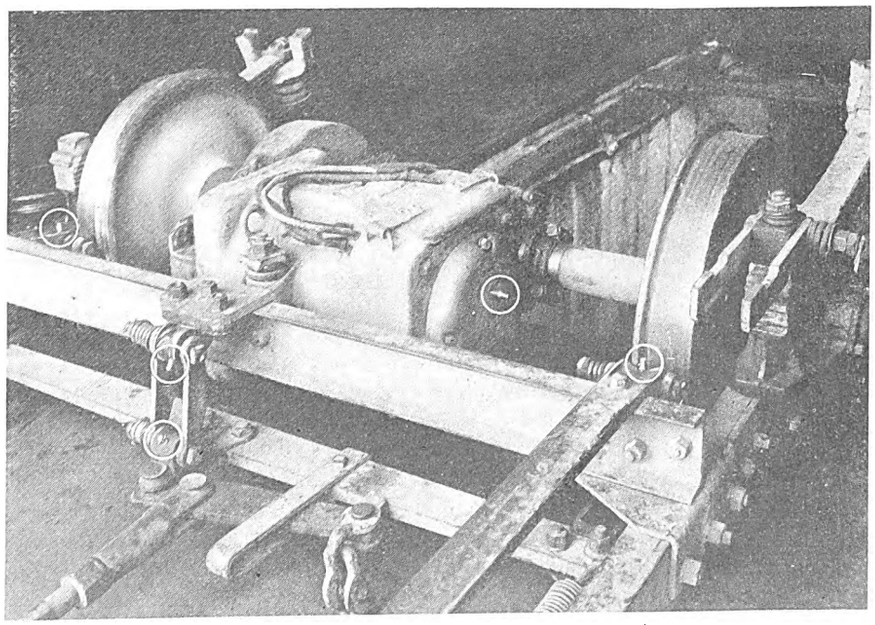
By J. Ed Lawless
Master Mechanic El Paso Electric Company, El Paso, Tex.

CONSIDERABLE reduction in time and cost for lubricating foundation brake rigging of electric cars has resulted through the use of Alemite fittings installed in various parts of the trucks by the El Paso Electric Company. This company has 40 single-truck Birney cars on which this method of lubrication has been installed. Economies have resulted particularly in the lubrication of half-ball hangers. It is difficult to lubricate the balls and sockets of these hangers as it is necessary to remove them both in order to get the grease in properly. One of the car truck inspectors of the railway conceived the idea of installing Alemite fittings on the shoe heads and hanger holders so that grease for lubrication can be forced into the sockets by using the standard high-pressure grease gun.

This plan has worked out very satisfactorily. As the cars are overhauled, each shoe head and hanger holder casting is drilled and tapped and a fitting is screwed in the end of the casting between the sockets so that grease injected through the fittings will be forced both ways along the bolt into the socket. Twelve fittings are required per truck. The time and labor of installing are small and the cost of the fittings amounts to only a few cents each.

The advantages of lubricating these parts by this method are shown in the reduction of time required. Tests were made to obtain actual figures of time and cost of labor saved. To remove the brake hanger bolts and put grease in the sockets requires 40 minutes' time of a truck inspector and his helper, 80 minutes for one man. This labor costs 47 cents. A helper can lubricate the hangers on a car equipped with Alemite fittings in four minutes at a cost of 2 cents for labor. The saving effected is one hour and sixteen minutes or 45 cents. The work of attaching the grease gun connection and injecting the grease is so simple that every car is assured of having the brake hangers lubricated at every inspection. The parts being amply lubricated will not wear nearly as rapidly and therefore the cost of maintenance is reduced. Also the noise of loose rattling brake hangers is eliminated.

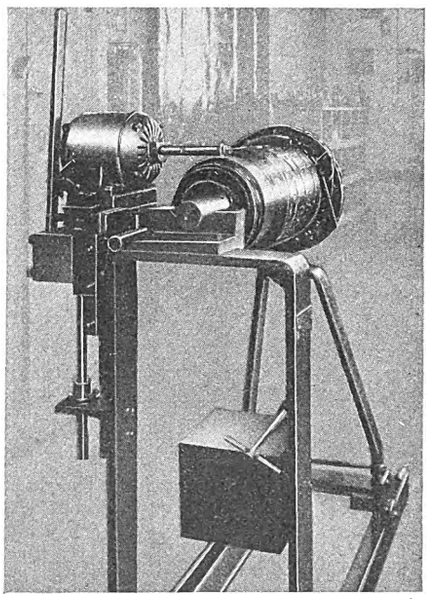
Try a "beauty shop" to keep your control fingers well manicured.



Circles indicate points on truck where Alemite fittings have been installed for lubrication

Convenient Commutator Slotter

IT IS not practicable in Atlanta to have the commutator slotter mounted on the machine where commutators are turned because bearings are fitted while the armature is in the lathe and the time does not permit of the additional work of slotting the commutator. Accordingly the slotter shown in the accompanying illustration was constructed in the shops of the Georgia Power Company. It is described in the brief submitted for the Charles A. Coffin Award. For the slotting operation the armature is mounted on V blocks on the stand. The pinion end V block is raised or lowered to level the armature. The depth to which the slotting saw will cut is regulated by an adjusting screw on the left leg of the stand, which raises or lowers the motor carriage.



Commutator slotter constructed in the shops of the Georgia Power Company, Atlanta, Ga.

The speed of the motor is 1,120 r.p.m. The saw is carried on an extended arbor which is adjustable to take care of various lengths of armatures.

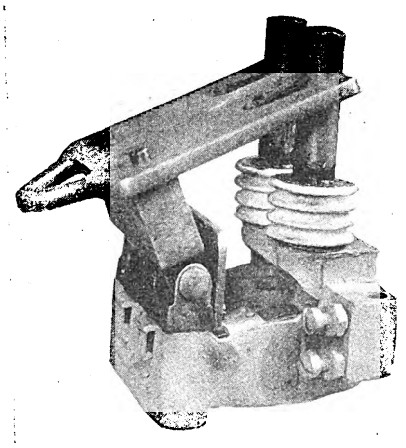
The motor is mounted on a pivot which makes possible the slotting of commutators which are slightly skewed. The upright supporting the pinion end of the armature is adjust-

Digitized by Google

able to care for various lengths of armatures. This machine provides a clean-cut job, uniform slots and speedy work.

Aligning Carbon Box With Brush-Holder Studs

DUE to rough handling of brush-holders, either before tney are installed in railway motors or during the process, the studs supporting the brush-holder framework may become bent, so that the carbon box is thrown out of its normal position in relation



Convenient type of fixture for gaging brush-holder studs and carbon brushways

to the studs. To check brush-holders just previous to installation and make certain that correct position of the carbon box is maintained a special fixture is used in the 65th Street shop of the Third Avenue Railway, New York City.

This fixture has a metal block machined accurately to the same size as the inside of the brush-holder carbon box. For some types of brush-holders the block can be slotted so as to fit around the contact springs and tips that rest on top of the brushes. The upper part of the block has a projection which acts as a stop when inserted in the carbon way and also provides for pivoting an extension arm to gage the position of the upright supporting rods. In the accompanying illustration the fixture is shown inserted in the carbon box of a brush-holder and the extension arm is just engaging the insulator studs. Where these are in correct position the arm with the two slotted sections can be forced down into a position so that the hinged block comes against the stop at the back of the metal piece which fits in the carbon box and the slotted arm is at a right angle to this. The slots in the extension arm are machined accurately so as to form a gage for the studs. The metal block forms a gage for the inside of the carbon box. A handle at the end is used to remove the fixture.

Use of this type of fixture has remedied troubles from brush-holders being out of alignment when installed in motors. Also, correct fit of the brushes in the carbon ways is assured and flashing due to incorrect position of the brush-holders is eliminated.

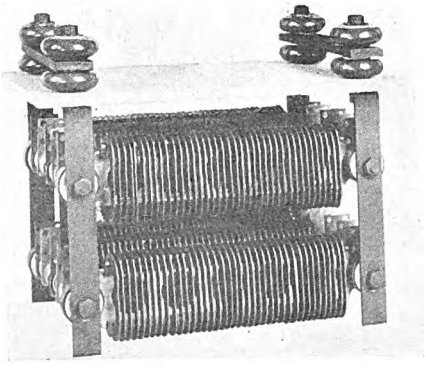
New Equipment Available

Edgewise-Wound Resistor

EDGEWISE-WOUND resistors, non-breakable and non-corrosive, have been placed on the market by the General Electric Company, Schenectady, N. Y. Resistors of this type are designed for use on electric cars, electric locomotives and gas-electric buses, and are particularly suitable where vibration and exposure to the elements tend to shorten the life of the more fragile cast-grid types of resistors.

The new resistor is light in weight. The six-unit type weighs approximately 50 lb. and the four-unit resistor approximately 40 lb. about half the weight of cast-grid resistors of corresponding capacity.

The resistor units are constructed of unbreakable, non-corrodible ribbon rolled from a special alloy. The joints are copper-to-copper and few in number, insuring minimum contact resistance. The ribbon is wound edgewise over heat-resisting and mechanically strong insulation, fitted over the edges of reinforced punched steel bars. The units themselves are



Form C, edgewise wound resistor

supported on steel rods with secondary insulation of mica.

The units are elliptical, conserving space and permitting the use of more active ribbon. The alloy has a practically constant temperature coefficient, resulting in but slight variation in resistance. Its specific resistance is materially higher than that of cast iron.

Terminals welded to the ends of the alloy ribbon insure perfect mechanical and electrical joints. Terminals at the ends of the resistor frame simplify the connection of leads and also facilitate making various series and parallel combinations. Clamp terminals for connecting to intermediate turns of each unit permit accurate adjusting of each resistance step.

Any single-coil unit can be replaced without disturbing the others. Both the four-unit and six-unit edgewise-wound resistors are interchangeable with certain forms of cast-grid and other types of General Electric resistors, all having identically located supporting bolt holes. In many instances, however, fewer boxes can be used than are necessary with the cast-grid types.

Safety devices make cars safe, modern renewals make them save.

Ticket Printer for Use in Ticket Office

STANDARD size cardboard tickets are issued on demand by a machine announced by the Ohmer Fare Register Company, Dayton, Ohio. The new ticket printer turns a cardboard slip into a railway ticket instantly with the name of the station of departure and destination, the date, the ticket number, the amount paid, the number of miles and such special instructions as may be desired.

Not only are the tickets printed and issued accurately and quickly, but a complete detailed record of all the essential information is printed automatically in duplicate on two control tapes. One of these tapes is accessible to the ticket seller at all times and is used by him for the purpose of checking and balancing his receipts. The other control tape is for

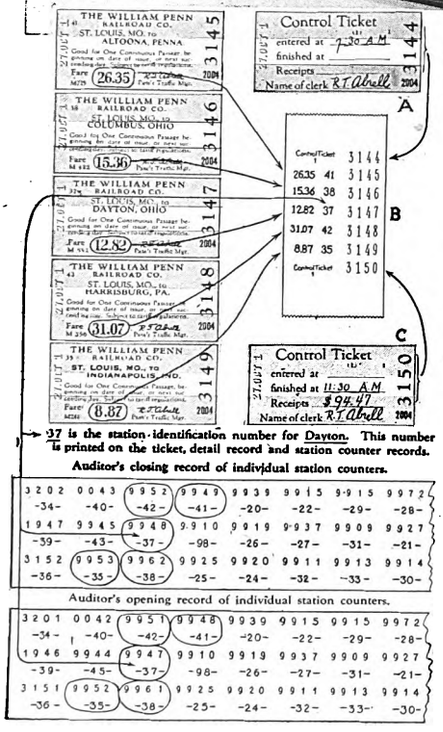
New type of printing machine for tickets to be used in ticket office



Sample set of tickets and records from an Ohmer ticket office ticket printer

A—Ticket seller's opening control ticket.
B—Ticket seller's detail record of all tickets sold. A duplicate of this record is locked in the machine for the traveling auditor.
C—Ticket seller's closing control ticket.

the use of the auditor and is accessible only to him or his authorized representative. It is removed at such times as may be desired for the purpose of checking and is filed as a permanent record of ticket sales.

In addition to the protection offered by the control tape, the machine is provided with segregating totalizers which are accessible to the auditor only, or his representative. From these totalizers may be taken at any time printed totals showing the number of tickets sold by the ticket office to any destination. From another automatic counter the total number of all tickets sold is visible at all times.

The ticket seller upon starting work prints and issues what is called a control ticket, upon which he enters his name and time of starting. At the end of his day's work he issues a similar ticket, upon which he enters the day's receipts and his name. He then becomes responsible for all tickets issued, as shown by the consecutive numbers between those of his starting and closing control ticket. The auditor's duplicate control tape bears a record of these control tickets so that no possible operation of the machine can be lost sight of.

In an accompanying illustration a series of five tickets are shown. The two control tickets were issued by the ticket seller to himself at the beginning and at the close of his working period. The closing control ticket gives the amount of sales as well as the quitting time. The first and last ticket numbers on the control record slip correspond with these two control tickets, and the five other numbers on the control record slip correspond to the numbers of the tickets actually sold. The amount of the sale appears on both the ticket itself and the control record slip, as do the figures representing the destination.

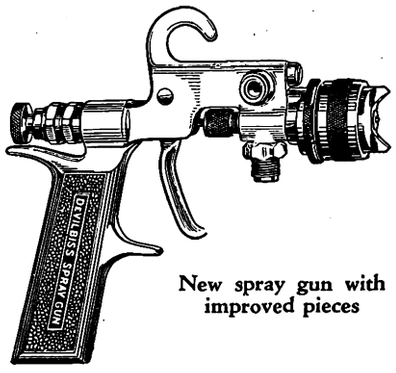
Taking ticket 3147, for example, we find it was sold to Dayton for $12.82. This amount also appears on the control record slip opposite the corresponding consecutive number, together with No. 37, representing the destination point (Dayton). No. 37 also appears on the ticket.

By following the line to the lower part of the illustration it is seen in the reproduced record taken from the segregating totalizer the opening count for tickets sold to date, namely, 9947, and, further up, the closing figure, 9948, showing that one ticket has been sold.

The mileage, as well as the amount of fare, is printed on the ticket. The ticket sold to Dayton for $12.82 shows M351, which indicates 351 miles. No. 2004, which appears on the ticket just below the consecutive number, is the station number from which the tickets are sold, in this case St. Louis. No. 2004 is also printed adjacent to the opening and closing numbers on the segregating totalizer for the total number of tickets of all kinds sold from that office.

Adjustable Head in New Spray Gun

FOR any spray painting system the principal unit is the gun. To provide for changed conditions in finishing and painting work, the De Vilbiss Company has just brought out a new spray gun with several improved features. One of these is the spray head with graduated adjustment to control both character and width of the fan spray. The graduated adjustment makes it possible to return quickly to a previous setting for producing any desired spray. The air can also be cut off to produce a round spray. This adjustable spray head eliminates split sprays and overspray and insures proper balance between the amount of material used, the nature of the work and the speed of operation.



New spray gun with improved pieces

Another improved feature is the self-centering of nozzle parts, making it impossible for these to get out of alignment.

The new gun, known as type AV, has a construction such that with low air pressure ranging from 40 to 60 lb. and a minimum air consumption, the material is finely, softly and evenly atomized and a smooth, uniform coating can be put on. Perfect atomization and uniformity of coating reduce sanding time and rubbing labor to a minimum.

The fluid tip is made of high manganese chrome alloy steel, double heat treated and ground to gage. The body is made of a special high-strength, heat-treated, alloy aluminum drop forging.

Association Activities

Human Engineering

By Charles M. Schwab
Chairman of the Board Bethlehem Steel Corporation

IF THERE is one outstanding slogan which serves as a common motto for American industry today, that slogan is expressed in the phrase "Safety First." The fact that this has become the outstanding slogan is an expression of the supreme management of American industry, namely, that the conduct of industry involves not merely the efficient direction of machines but primarily the guidance, the protection and the promotion of the welfare of human beings.

Human engineering—that's the real study of the great engineer of today:

Our railroads are realizing amazing results. I was told the other day that the great Pennsylvania Railroad has this fall been handling a volume of freight about equal to that of 1923 with one-third less equipment. Men are being paid better wages, conditions of work are being made better, the public is getting a better service; there is economy, profit and progress all around.

Our railroads, too, engaged in an occupation with many unavoidable hazards, give constant thought to safety—safety for their passengers, but, above all else, safety for the human being, without whom all the tracks, bridges, cars and locomotives in the world would not make possible the operation of a single railroad.

An unusual contribution to the promotion of healthy rivalry among railroads in attaining safety has been made by the American Museum of Safety. For some years before the war and since then—during the last two years—that organization has awarded annually, by virtue of the generous action of Mrs. E. H. Harriman, whose late husband was one of our greatest railroad men, the Harriman memorial medals, to those Class I steam railroads which, in their respective groups, have done the most during the year to secure progress in safety and accident prevention.

The gold medal for the year ended Dec. 31, 1926, has been awarded to the Norfolk & Western Railway. This railway has realized a most remarkable result, showing a reduction of 28 per cent in the number of persons killed for the year 1926, as compared with 1925, and of 15 per cent in the number injured. This result was obtained notwithstanding an increase of over 8 per cent in the number of miles run by its locomotives.

The members of the award committee were so impressed with the showing made by the Norfolk & Western Railway in 1926 that all members of the committee commented on it as one of the outstanding examples in recent years of the results of applying intelligent safety methods to railway operation.

The silver medal has been awarded to the Duluth, Missabe & Northern Railway. This company again shows a record of no passengers or employees killed during the year. This company realizes the additional distinction of winning the silver medal for the second year in succession.

The bronze medal is awarded to the Quincy, Omaha & Kansas City Railroad. This is a small railroad and one of the less prosperous, but it went through the entire year of 1926 without injuring a single passenger or employee.

I congratulate the management as well as the employees of each of these railroads upon winning these awards. Such results are not achieved by haphazard methods. The awards are made as a token of thought and vigilance during every hour of the day and night, the slightest lapse at any moment meaning danger if not disaster.

These railroads, and all the others who have participated in this competition, have made a new contribution toward the science of human engineering. May safety first and the welfare above all else of the human being continue to be the watchword of all our railroads and all our other industries.

Abstract of an address at a meeting of the American Museum of Safety at New York City, Dec. 28, on the occasion of the presentation of the E. H. Harriman memorial medals and special certificate to railroads for safety and accident prevention work in the year ended Dec. 31, 1926.

Program Announced for Midwest Meeting

MANY subjects of interest are listed on the program for the midyear meeting of the Midwest Electric Railway Association to be held at Hot Springs, Ark., Jan. 16 and 17. Following is the schedule of events for the two days:

Monday, Jan. 16

9:00 a.m.—Registration.

10:00 a.m.—Address of Welcome, F. Leslie Body, manager Hot Springs Chamber of Commerce.

10:10 a.m.—Response—F. G. Buffe, vice-president.

10:20 a.m.—"The Power of Leadership," by J. B. Wootan, editor *Public Service Magazine.*

11:00 a.m.—Résumé of the legislative situation at Washington, by Leslie Vickers, economist A.E.R.A.

11:30 a.m.—"Building Sales Instinct in Men," by R. C. Forman, Stone & Webster.

12:15 p.m.—Luncheon: (a) Subject, "Transportation Failures"—leader, R. C. Coffy, vice-president and general manager Fort Smith Light & Traction Company.

(b) Subject, "Mechanical Problems"—leader, W. J. Martin, chief engineer Northeast Oklahoma Railroad.

3:00 p.m.—Sightseeing trip for all delegates and guests.

6:30 p.m.—Banquet, Arlington Hotel; music by K. T. H. S. Orchestra and Missouri Pacific Colored Quartet.

"Relationship Between the Press and Public Utilities," by Walter M. Ebel, city editor *Sentinel-Record,* Hot Springs.

"The Industrial Opportunities of the Midwest," by Dr. C. H. Brough, former Governor of Arkansas.

Dancing.

Tuesday, Jan. 17

9:45 a.m.—"The Bus in Urban Transportation," by D. E. Druen, superintendent of bus maintenance Kansas City Public Service Company.

10:15 a.m.—"Developments in Modern Electric Railway Equipment," by Claude L. Van Auken, managing editor *Electric Traction.*

11:00 a.m.—"Municipal Transportation; Civic Responsibility and Performance," by C. M. Ballou, City Street Railway Commissioner, Cleveland.

11:45 a.m.—Business session.

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Jan. 6*—Metropolitan Section, A. E. R. A., Engineering Societies Building, 39 W. 39th Street, New York, N. Y., 8 p.m.**

***Jan. 16-17*—Midwest Electric Railway Association, Hot Springs, Ark.**

***Jan. 18-19*—Kentucky Association of Public Utilities, annual meeting Brown Hotel, Louisville, Ky.**

***Jan. 18-19*—Central Electric Traffic Association, Hotel Gibson, Cincinnati, Ohio.**

***Jan. 25*—Central Electric Railway Master Mechanics' Association, Hotel Gibson, Cincinnati, Ohio.**

***Jan. 25-26*—American Railway Association, Motor Transport Division, organization meeting, Palmer House, Chicago, Ill.**

***Jan. 25-27*—Electric Railway Association of Equipment Men, Southern Properties, Roosevelt Hotel, New Orleans, La.**

***Jan. 26-27*—Central Electric Railway Association, Hotel Gibson, Cincinnati, Ohio.**

***Jan. 31*—New York Electric Railway Association, annual meeting, Hotel Commodore, New York, N. Y.**

***Feb. 13-17*—American Institute of Electrical Engineers, winter convention, New York, N. Y.**

***Feb. 17-18*—Central Electric Railway Accountants' Association, Hotel Gibson, Cincinnati, Ohio.**

***May 2-5*—Southwestern Public Service Association, Dallas, Texas.**

***July 8-12*—Public Utilities Advertising Association and International Advertising Exposition, Detroit, Mich.**

SEPT. 22-28, 1928
American Electric Railway Association, 47th annual convention, Cleveland, Ohio.

News of the Industry

I.C.C. Grants Increase on North Shore Line

Intrastate passenger fares on the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., were ordered raised from 3 cents to 3.6 cents a mile by the Interstate Commerce Commission on Dec. 22. The increase, which was granted in order to remove unjust discrimination against interstate commerce, is to become effective on or before Feb. 15.

Appeal to the Interstate Commerce Commission was resorted to by the railroad following the refusal of the Illinois and Wisconsin Public Utility Commissions to allow an increase in rates within the two states. Claiming that the intrastate fares of the North Shore Line from Chicago to competitive Illinois points and from Milwaukee to competitive Wisconsin points ranged from 4 to 23 cents less than those of its steam railroad competitors and that on this account interstate passengers were being discriminated against, the railroad took its case before the federal commission. The interstate fares of the North Shore Line were increased last spring from 3 to 3.6 cents per mile, to match the steam railroads' tariffs.

Protection Sought for Car Men in Memphis

Two-men cars and armed guards on outlying runs are to be demanded by the trainmen in Memphis, Tenn., as a protection for car operators against bandits. This is the aftermath of the recent slaying of Robert H. Calvery, motorman on the Chelsea Avenue Line of the Memphis Street Railway. As a protection for its men the company meanwhile is employing special officers and plain clothes men to ride on cars making outlying runs. It has also offered a $500 reward for the apprehension of the slayer of Mr. Calvery. The union is offering a like reward.

Recommendations by New York State Mayors

The New York State Conference of Mayors, sometimes called the "third house" of the Legislature, will supplement the Governor's message by sending to that body its recommendations when the Legislature meets in January. Regarding utility legislation, the conference said it would urge the enactment of legislation of a permissive character which would give to the municipalities the right to acquire, construct, own, lease and operate within or without their corporate limits any public utility, product or service of which it was or was to be supplied to the municipality or its inhabitants, or to enter into contract for such service.

It would further urge the Legislature to enact a law which will give cities authority to own and operate buses.

Ceremonies Attend Power Station Opening at Norfolk

The new several million dollar addition to the Reeves Avenue power station of the Virginia Electric & Power Company at Norfolk, Va., was formally opened on Dec. 7. Special ceremonies were arranged for the opening which makes the plant one of the largest in the South and virtually doubles its capacity.

One-Man Cars to Be Run Over Steam Tracks in Sharon

Permission to operate one-man cars over steam railroad tracks in the city of Sharon, Pa., has been granted to the Shenango Valley Traction Company by the Pennsylvania Public Service Commission. Before the company can install the one-man operation the commission directs that it must adopt certain safety conditions.

The Shenango Valley Traction Company operates a line 17.73 miles. Its one-man cars will now run over the tracks of the Erie Railroad in Sharon, Pa. Train movements over the crossing are largely industrial and average about eight a day.

Atlanta Company Praised

State commission says that railway patrons in Southern city have enjoyed a fare for the past nine years that experience has shown to be too low

IN ITS opinion in the Atlanta fare case fixing the new fares on the city lines of the Georgia Power Company at 10 cents cash with four tickets for 30 cents or twenty for $1.50 the commission said that experience has demonstrated beyond question that the commission in the 1918 and 1920 cases fixed a fare too low. The state body says that if it had provided a reasonable fare in 1918 and 1920, the recent application would have had no excuse for existence at this time. The same authority says it may appear to some as unfortunate that this was not done, but be that as it may, patrons of the railway have enjoyed a fare for the past nine years that experience has shown to be too low.

Considering the scant earnings of the company for a long number of years, the commission did not feel justified in doing less than had been concluded to be reasonable, but at the end of twelve months from the effective date of the order just entered the commission will consider the earnings of the company under the new scale of rates, and if conditions at that time justify it, the commission will take proper steps to make due corrections.

In the commission's opinion the Georgia Power Company is now rendering the best railway service in its history, and certainly far in excess of any period experienced by any of its predecessors, due in no small degree to the splendid personnel in the operating department, "the motormen, conductors and other employees in the railway department being composed of as high a type of men as will be found anywhere in the United States." The commission says:

As shown by the record in this case the company operates under conditions which prevail in comparatively few cities throughout the country. The physical values of the railroad property include approximately $4,000,000 for paving the streets traversed by the various lines of applicant, which is required under franchises. It is also shown from the record that the company is required to pay to the city of Atlanta a gross receipt tax of 3 per cent of all revenues taken in. As a result of this street paving cost, there is charged to operating expenses approximately $100,000 for depreciation, and there is included in the return resulting from the rates approved herein $280,000, or a total of $380,000, which must be paid by the car riders on account of this street paving cost. As a result of the 3 per cent gross receipt tax, there is to be charged to expenses approximately $180,000. In other words, there is to be added to operating expenses, which results in a deduction from the net income, $560,000 per annum, due to the paving charges and gross receipt tax. These charges to operating expenses are conditions over which the commission has no control, but at the same time it is obviously necessary that these items of operating cost be considered in determining such a rate of fare as is necessary under conditions enumerated herein.

In the early part of 1924 the company petitioned the Mayor and Council of Atlanta for relief, and, among other things, asked the City Council to approve fares covered by the company's petition in the recent case. The record shows that the City Council advised the company it had no jurisdiction over the car fares, and without expressing an opinion for or against the petition, suggested that it was a matter to be considered by this commission. During the proceedings before the City Council it was agreed between the company and

Digitized by Google

Council that a valuation and audit should be made of the company's street railway property and its records, the cost of same to be paid by the company, whereupon the city employed nationally known engineers and auditors to do this work.

It was contended by the company that it was not earning a reasonable return on the fair value of its property devoted to the public use. Evidence submitted at the hearing showed a decrease in net earnings for the years 1921 to 1926, inclusive, except the years 1924 and 1925. The commission said:

In order to determine whether or not the company is earning a reasonable return, it is first necessary to determine what is the fair value of the railway property devoted to the public use on which the company is entitled to earn a reasonable return. In this case, the company submitted various values. What is known as the historical, or cost value, is based upon the value found by Engineer Baehr, in his appraisal as of March 18, 1912, which was made with the intention of leasing the properties of the Georgia Railway & Electric Company to the Georgia Railway & Power Company. The physical property, as found by Engineer Baehr at that time, excluding jointly used property, but including overhead charges, was $8,766,673. Additions and betterments to the property, not including jointly used property, from 1912 to Dec. 31, 1926, amounted to $7,378,162, making a total historical cost value of the physical properties, excluding jointly used property, but including overhead charges, as of Dec. 31, 1926, $16,144,836. Based on this historical cost, and adjusted to prices current as of Jan. 1, 1927, loss accrued depreciation, gives a value of $21,989,421.

The record shows that Engineer Baehr made another appraisal of the property, as of July 1, 1921, and the physical value found by him on that date, reproduction cost new, less depreciation, was $17,813,099. Additions and betterments to the property from July 1, 1921, to Dec. 31, 1926, amounted to $4,805,865, or a total value, less accrued depreciation, of $22,618,964. The value found by Engineer Beeler, in his appraisal for the city of Atlanta, excluding jointly used property, with additions and betterments to Dec. 31, 1926, is $19,614,216.

Engineer Luick submitted an appraisal as of Jan. 1, 1927. Mr. Luick's physical value as of that date, less depreciation, and excluding jointly used property, was $20,402,860. The physical value found by Mr. Luick, less depreciation, including jointly used property, as of Jan. 1, 1927, was $22,885,039.

It will be seen that all values above referred to do not include any amount for working capital or going concern value, which should be given consideration for rate-making purposes. Engineer Luick took the position that $450,000 should be allowed for working capital and $2,500,000 as going concern value, in the present case.

The commission did not in 1918 or 1920 nor has it in this case considered capitalization as a basis for the rates. The fair value of the property used and useful is the only basis the commission has at any time considered for the company, or any other company over which it has jurisdiction, in arriving at a fair value to determine a fair return.

The commission said:

Having in mind the consideration given by this commission of applicant's street railroad property, it is not surprising that in December, 1924, John A. Beeler, consulting engineer of the Beeler Organization of New York City, found occasion in his report to the city of Atlanta, dealing with street railway property of applicant, to express himself as follows: "With these rates of fare under the present operating conditions, eleven of the 22 railway lines are not taking in sufficient to pay the operating expenses. If this condition is not speedily righted, it is evident that the railway will not continue to function properly, and will be unable to finance itself. Properly to care for the growth and development of the community the additions and improvements outlined in this report must be made. This involved large expenditures, as is shown further along. To obtain the necessary funds, the financial condition of the railway must be radically changed. To accomplish this, either the revenues must be increased or the expenses decreased, or both. As shown elsewhere in this report, the net earnings this year (1924) are estimated to be $566,358, or sufficient to pay a return of 8 per cent on only $7,090,000. The discrepancy between these earnings and those necessary to place the railway on a sound footing is so great that the seriousness of the present situation is obvious. There is no time to permit of any unnecessary delay in adopting effective corrective measures, drastic though they may be. If the chief transportation agency of the community is to be paralyzed, it is not to be imagined for an instant that the results will stop there. The whole social, commercial and industrial fabric is dependent upon the proper functioning of the local transportation system, for it is to the community what the circulatory system is to the human body. Interfere with it and disaster is invited; kill it, and the community dies with it."

It will be recalled that the Beeler Organization was engaged by the city to study the transportation system in Atlanta.

The commission says that experience has demonstrated that it was too conservative in its judgment of what the future would reveal, with the result that the railway business would have long since been paralyzed had it not been for the sustaining credit and support of the company's light and power and gas properties. The company said:

Appearances Are Deceiving

There appears to be a common belief in the community served by the railway department that the highly maintained property in the way of roadway and equipment, is all sufficient evidence that the railway department has been prosperous, else this highly maintained condition would not exist. Nothing could be more erroneous. It is also apparent that there is a general belief that the large number of new cars purchased by this company during the last three to four years comes out of earnings, which is another error and without any foundation for its support.

On the question of valuation the commission said:

The Supreme Court of the United States, to our mind, has not been as definite in prescribing rules as a guide for arriving at a fair value as a proper rate base, as we believe should have been done. However, considering their expressions on this subject as a whole, it is very clear that they loan more to the reproduction cost new theory than to any other method. It is our belief that a strict adherence to the reproduction cost new theory would not be best for the company or the citizens it serves. Conditions could happen, as they have happened in the past, which, to apply such a method, would work disaster for the company as well as a hardship on the public, in so far as such would result in the loss of service. Such a theory, if applied in the last half of 1914, 1915 and 1916, would have bankrupted most of the companies throughout the country. However, taking the rates as approved in this case, applied to 1926 business, will not yield more than a reasonable return on a valuation far below the application of the reproduction cost new theory, plus going concern and working capital.

It was the opinion of the commission that the value of the railway property under consideration in this case, as of Dec. 31, 1926, was not less than $20,000,000 for rate-making purposes.

	1914		1920		1926	
	Wages per Hour Cents	Per Cent	Wages per Hour Cents	Per Cent	Wages per Hour Cents	Per Cent
Motormen and conductors	25	100	46	183	59	238
					54	215
Cost of living	...	100	...	210	...	168

One of the largest items of expense in the railway department is that of transportation cost, represented largely in the wages of motormen and conductors. The accompanying table shows the wages paid motormen and conductors during the years 1914, 1920 and 1926, as compared with the average cost of living in Atlanta during these years, using the wage scale and the living cost, as prevailed in 1914, as 100 per cent.

The record shows that the wage increase just indicated was made by arbitration. The wages shown in the record for 1926 are 54 cents per hour for two-man cars and 59 cents per hour for one-man cars. The commission, of course, has no control over this question.

The following is a statement of revenues and expenses for the year 1926:

Operating expenses	$3,720,165
Taxes	413,156
Depreciation	394,192
	$4,527,514
Revenue	$5,278,794
	4,527,514
Net	$751,280

Based on a value of $20,000,000 the net revenue just noted represents a return of approximately 3.8 per cent on the railway property of the applicant. The commission says this cannot be justified as a reasonable return, and shows conclusively that an increase in revenue is demanded.

The fare in Atlanta has been 7 cents cash, three tickets for 20 cents or fifteen for $1. There have been no children's rates. Under the new schedule school children are to pay a fare of 5 cents, but only when tickets are bought by them in lots of twenty for $1 at the company's office on presentation of a certificate signed by the principal or teacher. These tickets are to be good on schooldays between the hours of 7 a.m. and 4 p.m.

Liberal Franchise Granted to Key System for Richmond

A new street railway franchise has just been granted by the City Council of Richmond, Cal., to the Key System Transit Company which will become operative on Jan. 6 and continue in force for 50 years. It is one of the most liberal franchises ever granted to a railway, for in it the principle is recognized that the railroad should not pay for paving and that so long as the company lives up to the terms of the franchise the city has no right to grant competing lines other franchises. With this grant Richmond becomes the only city in California with a population of less than 25,000 persons which has a local street car system.

According to the provisions, referred to in the ELECTRIC RAILWAY JOURNAL for Dec. 24, page 1167, the city agrees to bear all the expense of repaving when such is made necessary by plans for regrading, improving the surface or changing the quality or quantity of the paving originally installed. The company agrees to make necessary repairs between its tracks and for a distance of 2 ft. on each side of them. It is further provided that the company shall not be required to relocate, move or rearrange any of its tracks, poles or wires for a period of three years from the time the franchise goes into effect. J. Paul St. Sure, an Oakland attorney, drew up the franchise. Negotiations of the company with the city were conducted by Paul Goldsmith, vice-president in charge of public relations.

Sunday Passes Sell Satisfactorily in San Francisco

One of the latest steps taken by the Market Street Railway, San Francisco, Cal., is the installation of a pass good all day on Sundays and certain holidays. As the company expresses the matter in the *Inside Track*, "judging by the ever-increasing number sold each week, 'it' is being very kindly received by our patrons."

Competition in selling these passes between conductors at the different divisions is getting so keen that the company is thinking about printing the names of the ten super-salesmen who sell the highest number of passes each month.

One conductor, who has been very successful so far, explained that he offers a pass to each boarding passenger, and says: "Ride all day! Only 20 cents!"

Existing Rates in Watertown Continued

The Public Service Commission authorized on Dec. 23 the Black River Traction Company and the Watertown Transportation Corporation, its subsidiary, operating in Watertown, N. Y., to continue its existing fare rates, 10 cents cash fare, seven tickets for 50 cents, until otherwise ordered by the commission. It was held that in view of continued operating losses sustained by the two companies and the action of the Watertown City Council in consenting to indefinite charge of the present fares the petition by the two companies should be granted.

Evidence submitted to Commissioner Brewster showed that the net deficit of the company in 1926 was $4,333 and for the first ten months in 1927 $4,511. The company in the past two years, by reducing its operating expenses, has decreased the deficit, but according to the memorandum by Commissioner Brewster there was no prospect of net earnings. Testimony also showed that the total revenue of the bus company for 1926 was $92,425, while its expenses of operation were $95,263, showing an operating loss of $2,837, and for the first ten months in 1927 there was an operating deficit of $4,467.

Problems of Greater Boston Transit Reviewed

The establishment of electric service over the Saugus branch of the Boston & Maine Railroad terminating at the rapid transit station in Everett, Mass., is discussed in the report regarding service in Greater Boston issued by the Division of Metropolitan Planning. This would be much more feasible financially, the report states, than the plan of running through rapid transit trains. Freight service must be maintained even though steam passenger service on the Saugus branch is abandoned.

Service by trolley is now furnished from Saugus to Lynn by the Eastern Massachusetts Street Railway, but to establish through service coincident with the use of the tracks for freight service the Metropolitan Planning report states that such service should be jointly operated by the Eastern Massachusetts and the Boston Elevated, the Elevated receiving all fares west and the Eastern all fares to the east.

Regarding through service from Boston to Chelsea and Revere the report mentions that there is already through service from Revere Beach to Maverick Square, the cars of the Eastern Massachusetts Street Railway operating over the tracks of the Elevated to that station and that both railways express a desire to accommodate the public. The injustices to the citizens of Chelsea and Revere on their not enjoying the privilege of a single street railway fare from their respective cities to downtown Boston and other parts of the metropolitan district was condoned. The Metropolitan Planning Board takes the position that in all probability acquisition of the Chelsea Division by the Elevated must be accompanied by some contribution from the two cities benefited. But the report expressed doubt whether the Eastern or the Elevated would act in this important matter until the Legislature had finally determined the future status of these two properties and decided whether public control over their operation was to continue.

Viaduct Contract Approved at Atlanta

Mayor Ragsdale of Atlanta, Ga., and President Preston S. Arkwright of the Georgia Power Company have approved a contract with the Georgia Power Company, Atlanta, Ga., whereby $400,000 will be contributed by that corporation toward the construction of the twin viaducts at South Pryor Street and Central Avenue. Actual signing of the contract makes the money available immediately. The contract, according to Mayor Ragsdale, assures ample funds for the completion of the two spans, the city's $1,000,000 having already been augmented by $500,000 from the county and $400,000 from interested railroads.

The contract provides that the present "jitney" ordinance remain in effect, but that in the event of its repeal the city shall pay the company $50,000. The agreement further stipulates that the $400,000 shall be charged against capital expenditure and used in rate making by the company; that interest on the $400,000 shall be paid the power company by the bank in which the money is deposited, until it is used for construction; that the power company shall have the right to lay tracks on both viaducts, and that it shall be assessed no part of the paving charges nor shall it be charged for maintenance save for its poles, wires, etc.

Special Service on Xmas Day in Memphis

Co-operating with the churches and as a convenience to its patrons the Memphis Street Railway, Memphis, Tenn., operated an early schedule of cars on Dec. 25. This provided for a run arriving uptown at 5 a.m.

Federal Tax to Be Deducted from City Payment in Chicago

Under a decision handed down by the Illinois Supreme Court on Dec. 20 the Chicago Surface Lines is authorized in computing the amount due the city of Chicago under the 1907 ordinances to deduct federal income taxes paid to the government. As a part of operating expenses the city sued the Surface Lines for $2,338,596 on the ground that the companies had no right to deduct federal income and excise taxes before computing the 55 per cent of net receipts due the city and insisting also that the city was entitled to interest on amounts tendered by the companies but refused by the city during the years 1920 to 1923, inclusive. The issue on deduction of federal taxes extended over a period of nearly seventeen years. The Chicago Surface Lines opposed both claims and its contention was upheld by a decision of the Appellate Court.

The city filed a petition for a writ of certiorari for appeal to the Supreme Court and in denying this plea the court sustains the Appellate Court decision.

Repeal of Half-Fare Rates for Massachusetts Pupils Opposed

Opposition to the repeal of half-fare rates for school pupils in Massachusetts was voiced by the Commissioners of the State Department of Public Utilities in a special request to the Legislature filed on Dec. 20. This body unanimously recommends against the repeal of the general law under which street and electric railways are compelled to transport pupils of public day or evening schools, vocational or private schools at not more than one-half the regular fare, "because of the doubt of any material benefits to many of the street railway companies and because of the obvious benefit of this statute to many people of small means, with families large and small, under the burden of obtaining an education for their children."

At the same time, the commissioners found that the statute was abused and while making no change in the fare rate, recommended that they be authorized to adopt such rules and regulations as might be deemed advisable to control the use of pupils' tickets.

In its report the commission said that the basis of the argument was the financial condition of the New Bedford & Onset Street Railway, serving the towns of Marion, Wareham and Mattapoisett and the desire of those towns to assist the railway in every possible way in order that it might continue operations. These towns paid for the transportation of their pupils and at least two of them, by votes in town meetings, indicated a readiness to pay full fare. This they could not do under the law.

The report is based on a resolution of the Legislature, directing an investigation of the subject, which was passed at the last session.

Co-ordination of Traffic Chief Problem in Chicago

A unification of the maze of conflicting traffic regulations in Chicago, Ill., resulting from divided authority among the police department, the various park boards and the country towns is to be attempted by three groups of experts authorized by the Greater Chicago Traffic Committee, which has been organized with Richard W. Wolfe, Commissioner of Public Works, as chairman and James Simpson, head of the city plan commission, as vice-chairman. Three sub-committees of five members each will take up the work of unification and co-ordination.

One of these sub-committees is made up of attorneys and is to work out a system of unified traffic laws. Another, comprising representatives of the police departments, is to evolve a system for the enforcement of regulations decided upon, and the third will consist of engineers who are to work out signal control and other technical problems.

The traffic committee was created a year ago in an effort to determine upon a code for the regulation of the movement of vehicles in the city and coordinate the rules of the 26 different governing bodies. Among the members of the committee are the Mayor, Commissioner of Public Works, City Comptroller, Chief of Police, three Aldermen, representatives of the Park Board and the chairman of the Council traffic committee.

Mayor and Comptroller of New York Bury the Hatchet

Mayor Walker and Comptroller Berry of New York have reached an agreement on the subway financing program of John H. Delaney, Transit Commissioner, whereby the Comptroller will raise no further objections and will certify in the 1929 budget to the necessity of amortization of $50,000,000 short-term subway construction bonds to be issued early next year. The Comptroller will not certify to the necessity of $13,000,000 amortization item in 1928 budget as was desired by the Mayor. The Comptroller believes the Delaney subway financing plan illegal and Leonard M. Wallstein, counsel for the Citizens' Union, will seek to get an injunction against the issue of $50,000,000 bonds as soon as they are advertised for sale.

Bus and Rail Employees in Akron Have Equal Educational Chances

Following successful results obtained from its school for bus operators, the Northern Ohio Power & Light Company, Akron, Ohio, has established a permanent training course for its electric railway operators. A course of study covering a period of six months, similar to that in use in the school for bus men, has been adopted. Schools have been established in Akron, Canton and Massillon. Dwight Foust, a former dispatcher and graduate of Wittenberg College, has been chosen instructor. The school has in no way changed the initial training received previously by new employees. This training continues.

Old employees in train service are required to attend one session of the school each week in each of the three cities. Training is by lecture and the schoolrooms are equipped with all the mechanical and electric devices in use on cars. Particular attention is paid to motors, safety devices, door operation, courtesy and safety. Plans call for completion of the course in six months with reviews every six weeks.

Not all of the trainmen are going through the school at one time, but the schools are to continue until every employee in the service either passes or fails the examination. Failures are not to be retained. When all have gone through school, future courses will be confined to new employees. It is not the intention of the company to have employees go through school and then drop the work. The trainmen will be required to attend school sessions at intervals following their graduation.

It will be recalled that the work of the Akron bus school was demonstrated at the convention in Cleveland.

New Franchise for Canton

A new form of franchise to be submitted by the Northern Ohio Power & Light Company in January to the newly organized City Council of Canton, Ohio, will call for a traffic commissioner, a service-at-cost-plus plan of fare and exclusive control of the transportation facilities of the city. It was expected that the franchise would be presented to the old Council because of its understanding of the transportation situation and study of the Beeler organization survey, but more time was involved in the preparation of the franchise, according to an official, than at first was thought necessary and it could not be placed in form for submission to the old Council.

The plan of operating under a city railway commission would follow that of Cleveland, where the Tayler grant is observed.

Subway Freight Contract Before Rochester Council

The subway freight contract that will be submitted by the city of Rochester, N. Y., to the New York State Railways and the five railroads entering Rochester was introduced in the Common Council on Dec. 13 by Alderman W. J. Ward, chairman of the Railroad Committee, and Alderman Patrick Cauley, chairman of the law committee. It was referred to the two committees for a public hearing.

The contract was drafted by Corporation Counsel Clarence M. Platt, who discussed its provisions with Mayor O'Neil and Frederick T. Pierson, president of the Common Council. These follow principally the provisions of the contract between the city and the New York State Railways whereby the subway is operated under the direction of Charles R. Barnes, commissioner of railways, as an extension of the service-at-cost contract.

It included provision for freight operation and incorporates the recommendations made by the Mayor's subway committee, of which John P. Morse is chairman. The New York State Railways agrees to handle expeditiously all freight cars between the railway's connection with the subway railroad and points on the subway, performing equal service without discrimination for all carriers having similar agreements for trackage rights over the subway and for all shippers and consignees.

Safety Campaign in St. Joseph

A safety movement has been started by the St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., with the organization of a safety committee. Fred E. Henderson, superintendent of the railway, was made chairman of the committee. A definite program has not been outlined. The object of the committee is to promulgate principles on safety among railway employees and public. Meetings will be held regularly.

Subway Construction Plan Suggested by Mayor Thompson

Announcement of a new plan for subway construction in Chicago was made Dec. 29 by Mayor William Hale Thompson. He proposes widening and double decking the streets by building a level below the present street level. On either side of an open sunken roadway would be two rapid transit tracks for electric railways and above these tracks, on the original street level, would be roadways for trucks and slow-moving vehicles. The sunken roadway in the center would be given over to high-speed automobile traffic. The Mayor states that his plans are tentative only, subject to public approval.

Corporation Counsel Ettelson ruled recently that under the law assessments for subways can be spread over a period of twenty years instead of five years. It is thought this may obviate the need of special legislation for subway construction.

$800,000 Expenditure Suggested for Toronto Rehabilitation

Double-tracking the Mimico radial line as far as the Etobicoke and making it an extension of the city system of Toronto, Canada, at a cost of $800,000, is the outstanding plan in a report submitted recently to the Board of Control by the Toronto Transportation Commission. The cancellation of licenses of bus services running in competition with the lines is a condition of the plan. The board deferred action pending consideration of the matter by city officials.

The report concerns mainly an agreement entered into by the commission, the municipalities of Mimico, New Toronto and Etobicoke and the Minister of Highways, whereby the tracks on the Mimico line would be laid double in the center of the new paved highway and the line made an extension of the city service. Separate fares would be charged outside the city. Cancellation of the licenses for buses, which are said to have seriously impaired the earnings of the railway and provision of a through service with city cars making possible many economies by using joint facilities, were emphasized in the report. The report says:

> The money for capital construction would be provided by the investment of the T.T.C. reserves, and the city would not be required to issue further debentures for this radial. While we do not estimate that a surplus will be possible on this line, neither do we anticipate that, once established, the reconstructed line will be a burden to the city system.

The report refers to the transfer of the line to the Toronto Transportation Commission last January, when the annual deficits were approximately $110,000. The estimated increase in revenue through improvement in the service and elimination of bus competition is $98,000. A loss to the city system of $150,000 annually by buses bringing passengers to the center of the city would also be eliminated, it is thought.

The agreement with the municipalities provides that the T.T.C. shall double-track its line and remove it to the center of the highway; maintain connections with the city line; charge fares not greater than are sufficient to maintain the railway; and that the municipalities, so far as lies in their power, shall prevent the operation of competing transportation.

New Regalia for Cincinnati Men

All motormen, conductors, coach operators and supervisors of the Cincinnati Street Railway, Cincinnati, Ohio, have just been fitted out with new standard badges, while the supervisors have also been equipped with new overcoats which complete their new outfits.

Dignified insignia on Cincinnati caps

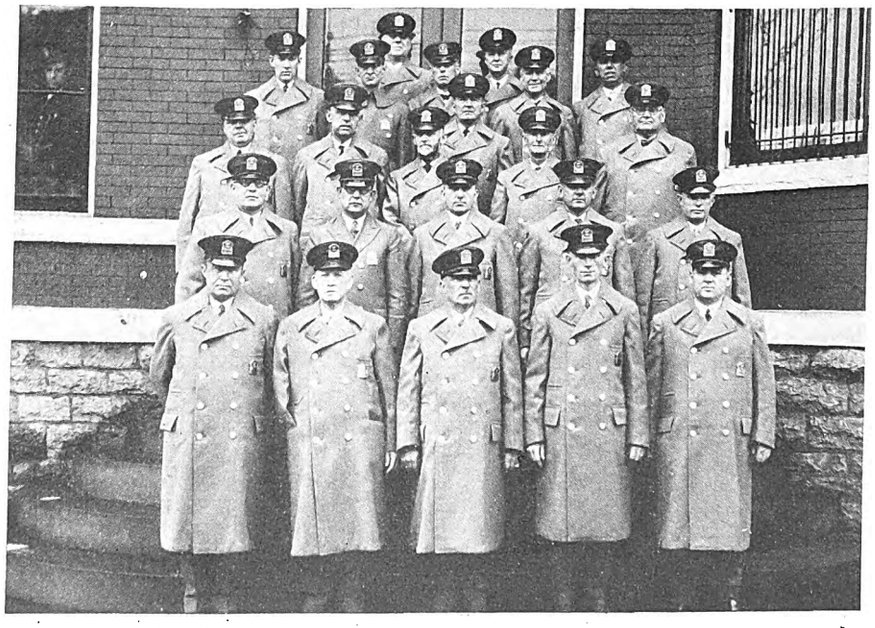
The new badge is the same standard design for all groups, but it has the official appearance of a policeman's badge. The company's trade mark is reproduced in the upper section in its regular colors and the identification marks, i.e., position or number, appear in the base.

The motormen's and conductor's badges are worn on the front of the caps only. They are nickel-silver finish. They carry the number of the man on the identification plate. Those worn by the coach operators are bronze, and in addition to numbers they carry the words "Coach Operator" on the identification plate. These are also worn on caps only. Both the street car and motor coach supervisors' badges are gold plate. In the case of the srteet car supervisors the word "Supervisor" appears alone, while the words "Coach Supervisor" are used to identify the other group. These supervisor badges are worn on the chests as well as on the caps. The Whitehead & Hoag Company, Newark, N. J., made the badges.

Formerly the men wore two number plates, one on each side of their caps, and a long name plate on the center of their caps. The nameplate carried the word "Conductor," "Motorman" or "Inspector" along with the operating company's name.

In addition to changing the entire character of the badge the numbering system has been revised. Conductors and motormen have hyphenated numbers, that is, 9-150. The first numeral designates the division and the second the man's number in that division. Even numbers are used for motormen and the odd for conductors. The numbers of coach operators are not hyphenated. They run from 100 up.

The new overcoats which the supervisors just donned were the last thing needed to complete their outfits. They now look like a staff of French generals on parade. These new coats are made of 24-oz. poilu gray serge overcoating. They were tailored by the Fechheimer Brothers Company, Cincinnati, Ohio.



Appearance counts more than ever in Cincinnati

Santa Barbara Case Reported

California commissioner sees need for increased patronage through modernizing and merchandising methods. Results of new fare plans discussed

RESULTS of the study of possible means of increasing the net income of the Santa Barbara & Suburban Railway, at the same time maintaining good service and reasonable rates, were submitted at a hearing before Railroad Commissioner William J. Carr on the application of that company for an increase of rates, held at Santa Barbara on Dec. 9.

The report was submitted by J. G. Hunter, transportation engineer of the Railroad Commission, who has conducted a thorough investigation of the operating and financial conditions of that utility, assisted by Ward Hall and W. H. Gorman, engineers of the transportation division of the Railroad Commission.

Mr. Hunter reported that in his opinion the solution of the problem of obtaining revenues sufficient to meet the operating needs of the company and still allow a fair return upon the property will not be met entirely by an increase in fares. His conclusion is that the most important need of the company is not so much increased rates, but an increase of patronage. A city of the size of Santa Barbara presents real difficulty in determining the best course for a transportation company to follow in order to increase its patronage, thereby increasing the net income. For this reason the commission's engineer urged that the company should lend every effort to obtain more passengers. Engineer Hunter reviewed in his report a number of ways whereby this might be accomplished. Among these plans are low bargain rate fares during the hours 9 a.m. to 4 p.m., aggressive merchandising methods by the company to build up its revenue, improved service, upholstering its cars with leather seats, faster service, neater cars and less noisy operation.

The report deals with a number of plans emphasizing the need for getting away from odd coin fares, and the use of the weekly pass. The following fare plans are discussed in the report:

1. 8-cent straight cash fare.
2. 10-cent straight cash fare.
3. 10-cent cash fare—$1 weekly pass.
4. 10-cent cash fare—$1.25 weekly pass.
5. 10-cent cash fare—three tokens for 25 cents, $1 weekly pass.
6. 10-cent cash fare—three tokens for 25 cents, $1.25 weekly pass.
7. 10-cent cash fare—three tokens for 25 cents, $1.50 weekly pass.
8. 10-cent cash fare—5-cent midday fare, $1 weekly pass.
9. 10-cent cash fare—5-cent midday fare, $1.25 weekly pass.
10. 10-cent cash fare—25-cent weekly pass, entitling rider to 5-cent fare.
11. 10-cent cash fare—five tokens for 35 cents, twenty tokens for $1.

The estimated results of operation under the present fares during the year 1927 were computed by the commission's engineers as follows: Operating revenue, $123,450; operating expense, $121,000; depreciation (6 per cent sinking fund annuity basis) $11,194; total expense $132,194; net operating revenue (loss) $8,744; taxes $7,988; net operating income (loss) $16,732.

Results of the fare plans discussed are estimated by the commission's engineers as follows: (1) $19,737 increase; (2) $26,112 increase; (3) $15,463 increase; (4) $20,322 increase; (5) $10,355 increase; (6) $15,956 increase; (7) $20,334 increase; (8) $1,998 decrease; (9) $3,027 increase; (10) $6,383 increase; (11) $23,023 increase.

Rapid Transit in St. Louis Under Discussion

Mayor Victor J. Miller has made known that A. L. Shapleigh, president of the St. Louis Public Service Company, St. Louis, Mo., has asked for a conference to be held shortly after New Year's on the so-called "service-at-cost" ordinance. The company hopes to obtain a 30-year grant on that basis.

Many opinions are being expressed on rapid transit plans for St. Louis. When reporters queried Mayor Miller on rapid transit, he replied that "plans for rapid transit are included in the service-at-cost ordinance for the St. Louis Public Service Company." C. E. Smith, retiring city consulting engineer, said at a recent dinner in his honor that rapid transit was one of the things the city needs most.

Franchise Extension in Chicago

A 30-day extension of the Chicago surface lines franchises was granted by the Chicago City Council on Dec. 28. Under the terms of the last extension the franchises would have expired on Dec. 31. Mayor William Hale Thompson and Governor Small were to confer on Dec. 30 on the inclusion of subway and railway legislation in the special session call to be issued by the Governor early in January.

More One-Man Cars in Atlanta

That one-man cars will be used wherever the operation of such cars is possible was indicated on Dec. 3 when the first of a new series of one-man cars was introduced by the Georgia Power Company on the Inman Park line, the oldest street-car line in the city of Atlanta.

There are now about 150 one-man cars in operation in Atlanta. In this connection company officials point out that the savings made by the use of the cars have been invested 50 per cent in increased service to the public, 25 per cent in increased trainmen's wages and 25 per cent in added income for the company. Company records, it was said, show an increase in patronage for the one-man car lines, indicating that they are well liked by the public.

Advertising the Liberty Bell Route in Pennsylvania

Two advertisements high in contrast but clever have been effective in creating interest for the Lehigh Valley Transit Company, operating in Allentown and points throughout southeastern Pennsylvania. They are features of an active, attractive campaign of advertising which the company has taken up with good effect in the newspapers throughout the territory it serves.

The Lehigh Valley Transit Company operates an electric line, with splendid parlor cars, to Philadelphia, at lower rates and more comfortable traveling, than the railroads. Receipts from the line are a big item in the yearly financial scheme and use of the road must be constantly pushed.

At that season of the year, when all of eastern Pennsylvania was observing the 150th anniversary of the carrying of the Liberty Bell from beleaguered Philadelphia to Allentown for hiding, the advertising force of the organization was producing clever copy with a historical basis.

The route to Philadelphia was named the Liberty Bell route in the very beginning. Recently, however, it was learned that the route very closely follows that of Frederick Leiser and John Jacob Mickley, who hauled the revered bell in their oxcart over the rough roads of that period to its hiding place beneath Zion Reformed Church in Allentown.

An advertisement is headed by a line drawing showing the fine trolleys of the route, with the old oxcart, bearing the Liberty Bell, just beside it. A map shows the conformity of the two routes, the one in the Revolutionary days and the other in the present.

From a humanitarian, as well as a business standpoint, the railway has taken cognizance of the very dangerous present to attract attention in another of its advertisements.

Every conceivable effort is being directed toward the elimination of accidents on the company's lines. They are costly in the extreme. Injury to human life means claims. Smashups mean property damages. Accidents often bring unjust condemnation.

The company took into consideration the recent opening of the Allentown schools. More than 16,000 children from the ages of six to eighteen left upon their journeys to school—journeys which were to be repeated almost daily. They crossed streets and tracks.

Consequently, the advertising forces devoted one large newspaper insertion to a timely co-operative message. They urged that teachers instill the safety idea into the children. They even offered suggestions for the youngsters to protect themselves when forced to cross heavily traveled streets.

Its very unselfishness, and the fact that it was obviously no outright advertising for the company's benefit, made the copy highly attractive. At the same time it effectively carried the idea that children could ride to schools in the trolleys in safety.

Recent Bus Developments

Bus Feeder Service Is Popular With Chicagoans

Popularity of the feeder bus line established in Chicago, Ill., last fall by the Chicago Surface Lines from the end of the Diversey Avenue car line to Laramie Avenue is shown by figures which have just been revealed for October, the second complete month of operation. During that period the big Fageol "Twin Coaches" used in this service carried 125,349 passengers. Although the Illinois Commerce Commission provided for operation of the line only to Laramie Avenue, applications for the extension of the bus service as far as the western city limits have recently been filed by several local business associations.

The November traffic and net earnings report, for the entire system, issued Dec. 20, shows a decrease of 317,859 in revenue passengers carried as compared with the month of November last year. The November total of 131,253,211 is also 4,166,012 less than the figure for October of this year. Earnings for November were proportionately lower.

Bus Request Put Over in Jacksonville

The request by the Jacksonville Traction Company, Jacksonville, Fla., of the City Council for permission to operate buses in Murray Hill has been referred by that body to the public service committee of the Council. The letter of the company asking permission to operate the bus service stated that the company intended to comply with all laws of the city, and outlined a schedule and route, but it was the sense of the majority of the Council that an agreement between the city and the company should be drawn by the city attorney before a permit was granted.

Bus Extension in Westfield Planned

Extension of its bus line in Westfield, Mass., is planned by the Springfield Street Railway, Springfield, Mass. This change will accommodate patrons not served under the present system of transportation. The State Department of Public Works and the City Council of Westfield have approved the expansion of bus service, but the Public Utilities Commission has taken the matter under advisement.

Buses the Talk of the Hour in Kansas City

Bus lines in Kansas City, Mo., their possible extensions, alterations of routes, and the question of additional equipment, is now being discussed by the directors of the Kansas City Public Service Company. The entire bus question is a lively issue now, with various communities asking a liberal use of buses on suggested "feeder lines." At present the question in Kansas City has two angles —the argument that bus lines should be more extensively employed in extending service to communities lacking railway service and, on the other hand, the financial losses.

The present fares are 10 cents on all bus lines except the express line in the Country Club district, which operates at a fare of 25 cents per person. The deficit in bus operation in 1926 was $307,000, but operating economies have reduced the loss this year to about $160,000. A new arrangement covering tires is said to have saved $75,000.

Bills to Regulate Interstate Commerce

Matter expected to be taken up actively after hearing before commission on Feb. 10. Digest of provisions of measures

TWO bills to regulate interstate buses have been introduced in the federal House of Representatives, one by Mr. Dennison of Illinois and the other by Mr. Parker of New York. The legislative committee of the Bus Division of the A.A.A. and representatives of the National Automobile Chamber of Commerce are co-operating in an effort to determine what ammendments if any are needed to make the bills more equitable and practicable. It is understood, however, that the House committee on interstate and foreign commerce will take no action on any bill until the proposed report of the Interstate Commerce Commission on its interstate bus and truck hearing is presented.

Bill Follows A.A.A. Principles

H.R. 19, introduced by Representative Dennison of Illinois, called the Dennison bill, generally follows the original ideas and principles laid down by the legislative committee of the Motor Bus Division of the A.A.A., of which S. A. Markel is chairman. A similar bill has been introduced by Senator Watson of Indiana, chairman of the Senate interstate commerce committee.

H.R. 5640, introduced by Representative Parker of New York, is identical with the Cummins bill of 1925. This provides for the regulation of both buses and trucks engaged in interstate commerce. The bill provides that the certificates of convenience and necessity be granted by the members of the State Regulatory Commission, acting as federal agents, with the right of appeal by the applicant to the Interstate Commerce Commission in case of adverse decision.

The Dennison bill automatically grants certificates to carriers operating in good faith at the time of the United States Supreme Court decision in the so-called Buck case, namely, March 3, 1925. Services on the highways started since that time are required to prove the convenience and necessity of their operation.

Another important difference between the Parker and the Dennison bills is that the latter requires the carrier to render service commensurate with the demand, whereas the Parker bill grants certificates only to individual vehicles and requires additional certificates to either increase or decrease the number of vehicles in service. Furthermore, the Parker bill requires that in fixing rates consideration be given to the kind and character of service to be performed, the public necessity therefor and the effect of such tariffs and rates upon other transportation agencies, with the idea of averting as far as possible unreasonable competition with existing services furnished by other carriers, motor or rail. This provision is not included in the Dennison bill, the nearest approach being Section 6C, which states:

> In determining whether or not public convenience and necessity warrants the granting of a certificate, the board or commission hearing such application shall give reasonable consideration among other pertinent matters to the public convenience and necessity and the character of transportation proposed, to available transportation services, to the character of service to be rendered by the applicant, and to the likelihood of proposed service being adequate, permanent and continuous.

Matter in Hands of Committees

At a meeting of the legislative committee of the Bus Division held in Washington on Dec. 2 to discuss the matter of interstate regulation a drafting committee was appointed to urge Representative Dennison and Senator Watson to introduce the bills mentioned in order to get the matter before the committees on interstate and foreign commerce. The whole matter of the regulation of the interstate bus and truck carriers is to be still further considered by a sub-committee consisting of S. A. Markel, George P. McCallum and E. W. Wakelee, who will draft any substitute provisions that might be required. Lorne Brown, representing the National Automobile Chamber of Commerce, will work with this subcommittee in a study of the need for amending the bill before hearings are held by the House interstate committee.

I.C.C. Argument Put Over Until Feb. 10

The Interstate Commerce Commission has announced that the argument in the Motor Bus and Motor Truck Docket has been reassigned from Jan. 16 to Feb. 10. Frequent reference to the comparative youthfulness of the bus and truck industry is made by various parties in the pages of this docket, and this fact is used as a plea that regulatory legislation for interstate traffic be postponed until conditions have become more stable. Regarding this contention, Commissioner Esch makes the observation:

I have in mind the thought that, had Congress regulated traffic by rail carrier years ago, much of the time and labor of the Interstate Commerce Commission might have been avoided, and many actions now brought to us for consideration might have been obviated.

For the purpose of bringing out the facts in this case, briefs were submitted on the behalf of the Erie Railway, the New York, New Haven & Hartford Railroad, the American Electric Railway Association, the Oregon State Highway Commission, the Association of Railway Executives, the Motor Coach Association of the State of Washington, and the Department of Public Works of the State of Washington.

The American Electric Railway Association brief, prepared by the late Charles L. Henry, general counsel, reviews the history of interstate commerce regulation and observes that beyond a doubt Congress intended in passing the regulatory act, to control all carriers. This brief goes on to show that many electric railways have supplemented their rail service by the operation of buses and, in doing this, have invariably sought authority from the states or municipalities. Such bus operation, it is contended, is frequently subject to competition from other bus lines pretending to be engaged in interstate business and are thus able to operate where they will.

Alfred P. Thom, general counsel of the Association of Railway Executives, prepared the brief submitted by that organization. His primary purpose is to dispel the idea that the desire to regulate interstate bus and truck traffic had its origin with the steam carriers.

The Motor Coach Association of the State of Washington believes that regulation of interstate bus and truck traffic is impracticable at this time, but expressed the opinion that such regulation, when necessary, can be more expeditiously administered by the state than by Congress.

A New Terminal for Buses in Springfield

A bus terminal has been established by the Springfield Street Railway, Springfield, Mass., at the Worthington Street terminal for all out-of-town buses. Previously the location of the Springfield terminal for these buses was at Court Street and permission was obtained from the transportation board to make the change. In anticipation of increased congestion at Worthington Street the company has secured an option on adjoining property which it plans to exercise. An addition to the building is planned.

To co-operate with the Springfield company a modification of the routing of buses of the New England Transportation Company is in prospect. This would be advantageous to bus patrons in making connections.

Claim of Prior Rights Disallowed

Commission holds a highly competitive service would be created if it sustained applicant's plea

THE Public Service Commission of Pennsylvania has restrained the City Transfer Company from operating motor vehicles on a schedule over fixed routes in Harrisburg until it obtains a certificate of approval.

The City Transfer Company was chartered on Jan. 6, 1904, for the purpose of "transferring persons and property to and from the railroad stations, from railroad station to railroad station, and to and from points in the city of Harrisburg and vicinity by means of coaches, cabs, carriages, wagons, horse power or automobiles or conveyances of similar character."

The company claimed that since it was chartered prior to Jan. 1, 1914, before the commission was organized, it did not need the commission's approval for its proposed scheduled service.

Upon the announcement of the company of its proposed plan to operate buses to various parts of the city, complaint against the proposed service was filed by the city and the Harrisburg Railways in the Dauphin County Court and a preliminary injunction was issued by the court.

By agreement of the parties the injunction was continued until the matter could be submitted to the Public Service Commission and determined by that body.

After declaring that a highly competitive service would be created if the commission sustained the transfer company's contention, the order said:

We are of the opinion that under our organic law, the interpretations of it by the court, and the administrative discretion which is lodged with the commission, there is authority for a duty resting upon us to sustain the complaints.

The route which the company proposed to establish and operate with 29-passenger capacity buses on a 10-cent fare was from Market Square to the John Harris High School. The major portion of the proposed route is now served by the Harrisburg Railways, which extended its lines to the High School in 1926.

A portion of the report of the commission says:

The City Transfer Company has never since its incorporation furnished any transportation service on a regular schedule between fixed terminals of the kind and character it proposes to inaugurate. The only service furnished by the company, prior to Jan. 1, 1914, in any way similar to scheduled service was the use for a short time, after its incorporation, of a horse drawn bus which in going to and from the railroad station made stops at three hotels to take on passengers to outgoing trains or deliver incoming passengers to these hotels, all located within a few city blocks of the railroad station.

As just indicated, the City Transfer Company attempted first to operate a route of buses on the theory that its state charter, being issued in 1904, did not bring it under the jurisdiction of the city or the commission. The city instituted injunction proceedings against the transfer company and the railway joined with the city. The transfer company, the city authorities and the railway appeared before the commission at a series of hearings.

This is believed to be the first time in the State of Pennsylvania that a transfer or taxicab company under charter from the state antedating the creation of the Public Service Commission has claimed that it could operate as a public utility without being under the jurisdiction of the state commission and obtaining a certificate of public necessity. If the commission had ruled otherwise than as it did, any other taxicab or transfer company in any city in the State could then have operated as a public utility without being under the jurisdiction of the Public Service Commission.

Partial Bus Substitution in Oakland Sought

The Key System Transit Company has applied to the California Railroad Commission for permission to discontinue railway service over its Rockridge line in the city of Oakland and to substitute bus service for a period of 90 days. It is proposed to operate on a twenty-minute headway.

Buses Out of Omaha Shorten Run

The Nebraska State Railway Commission has authorized the private persons now operating the buses once owned by the Omaha & Lincoln Light & Railway Company, a McKinley corporation, to curtail the length of their runs so far as the city of Omaha is concerned. The railway ran cars to Papillion and Ralston, but these proved to be losing propositions, and it was allowed to substitute buses. These were disposed of when the company was absorbed by a consolidation of power companies. The bus men said that they would have to cut out Papillion service if they had to duplicate the railway service from South Omaha to Omaha proper, and after a hearing and consultation with patrons served the schedule was rearranged to provide for a northern terminus at 24th and N Streets, Omaha.

Financial and Corporate

$2,650,000 Purchase of Central California Traction

The new agreement approved by the Interstate Commerce Commission under which the Southern Pacific, Western Pacific and the Santa Fe Railroads are to acquire joint control of the Central California Traction Company, operating an electric railway between Stockton and Sacramento, calls for the Fleishhacker interests to sell to the Southern Pacific, as of Dec. 31, 1927, all the outstanding stock and bonds of the electric railway for $2,650,000 in cash.

The Fleishhackers are to guarantee that the electric railway will have no indebtedness of any kind, except the principal amount of outstanding bonds and a proportionate amount of property-tax liability. If less than all the bonds are delivered by the seller, the agreed purchase price is to be reduced by the par value of any bonds of the carrier remaining outstanding in other hands.

The Fleishhackers further agree that within two years, at their own expense, they will remedy any defects or encumbrances affecting lands and rights of way of the electric railway, providing they are notified by the Southern Pacific by June 30 of next year. The ruling of the commission says:

Prior to the transfer of the stock and delivery of the bonds, the carrier (electric railway), in consideration of the guarantee personally assumed by the seller, is to convey to Fleishhacker the title to all its electric railway properties in the city of Stockton (a street car line operated under lease by the Stockton Electric Railway, which is a subsidiary of the Southern Pacific), with certain exceptions and reservations, and Fleishhacker, in turn, is to sell such properties to the Stockton Electric Railroad in consideration of the delivery to him of $100,000 of Pacific Electric Railway first refunding mortgage bonds.

The Southern Pacific agrees that immediately upon the acquisition of the carrier's stock and bonds, it will admit the Western Pacific and the Santa Fe to participation equally with the Southern Pacific upon payment by each of those carriers of one-third of $2,650,000 or such lesser sum as shall represent the purchase price of the securities.

Brief reference to this proposed purchase was made in the ELECTRIC RAILWAY JOURNAL in the issue of Dec. 10, page 1083.

$29,000,000 of Central Illinois Mortgage Bonds

Refunding operations of the Central Illinois Public Service Company, Springfield, Ill., in which the retirement of practically all of its higher rate issues and underlying bonds is contemplated, were brought to light recently with the announcement of an offer by Halsey Stuart & Company, Chicago, of an issue of $29,000,000 of the utility's 4½ per cent first mortgage bonds, series F. The bonds to be retired include three issues of first mortgage and refunding bonds in the principal amount of $16,450,000, with interest coupons ranging from 5½ to 6½ per cent and seven underlying issues amounting to $11,101,500. The proceeds of the new bonds will be used to reimburse the company's treasury for additions and extension to property as well as for the retirement of the higher interest bearing securities.

The present financing, it is pointed out, will result in a substantial saving in interest charges, simplification of the company's financial structure and an improvement in the mortgage position of the company's bonds.

Payment Date Postponed in O'Fallon Case

The Interstate Commerce Commission has postponed from Feb. 15 until April 30 the effective date of its order requiring the St. Louis & O'Fallon Railway to pay the government $226,000 of excess earnings. This action is taken to permit the carrier to appeal to the Supreme Court from a recent decision of the federal court in Missouri upholding the order of the commission.

Position of Third Avenue on Income Bond Interest Upheld

Judge John Knox in the U. S. District Court at New York has rendered a decision in favor of the Third Avenue Railway, New York, in an action brought by Thomas B. Jenkins and other holders of the adjustment 5 per cent bonds to have an injunction issued against the company restraining it from using its funds to promote bus service and requiring it to pay full 5 per cent interest and arrears on these bonds.

Judge Knox said in part:

The company, being confronted with peculiarities of transit conditions as they exist in this municipality, has been put to the necessity of acquiring control, through a subsidiary, of certain bus routes, which, if they come into possession of competing concerns, would have intefered seriously with earning capacity of the defendants.

In the main, the bus routes are closed by the defendants' lines of transportation, and in the hands of an antagonistic company the routes would be sharply competitive. To forestall this menace, I am of the opinion that the defendants' position in the premises is justified.

The accounting for which the plaintiff prays may show facts which will entitle him to some relief, but upon the present disclosure I am not satisfied that he should have injunction relief which is now sought.

The position of the company in the matter has been the subject of extended comment previously in the JOURNAL.

Operation to Cease in Albuquerque

The City Electric Company, Albuquerque, N. Mex., will discontinue operation on Jan. 1. About six months ago the company was placed in the hands of a receiver and the property was ordered sold for liens totaling approximately $59,000. Applications have been made for operation of buses in Albuquerque after Jan. 1, 1928.

With the cessation of railway service will pass the era of the motorettes, who have been operating the cars in that city since the days of the World War. The receiver has asked the business men to assist in obtaining work for the women who have been operating the cars.

Change in Name of Pennsylvania Company

The name of the Penn Public Service Corporation, a unit of the Associated Gas & Electric System, has been changed to the Pennsylvania Electric Company. This change in name is the only change, no merger or consolidation being contemplated. The Penn Public Service Corporation supplies railway service to the various boroughs and townships along the railway line from Philipsburg to Winburne, Pa., and also in the Borough of Du Bois.

North Shore Certificates Offered

A new issue of $720,000 par value equipment trust certificates of the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., bearing interest at 5½ per cent was offered Dec. 13 by Halsey, Stuart & Company, Chicago. The issue is being sold at prices to yield from 5.25 to 5.50 per cent, according to the maturities, which range from Dec. 1, 1933 to Dec. 1, 1942, inclusive. The creation of these certificates has been authorized by the Illinois Commerce Commission and the Railroad Commission of Wisconsin.

No Par Stock for Public Service, New Jersey, Approved

Issuance by the Public Service Railway, Newark, N. J., of 12,500 shares of stock without par value was approved on Dec. 24 by the Public Utility Commission.

The only witness at the hearing on the petition was Edward A. Tuson, general auditor of the transportation companies of Public Service, who stated that the commission in 1917 had approved the issuance of 12,500 shares of common stock of a par value of $100 each; that the company had never issued that stock and that it now wished to issue the no par stock instead, as its common stock now is of no par value.

The stock of the Public Service Railway is owned by the Public Service Corporation of New Jersey.

Offer Made for Saskatoon Municipal Properties

An offer to pay $3,500,000 for the power and distribution plant and the railway at Saskatoon, Sask., and to divide the net profits from their operation with the city has been made by the Dominion Electric Light & Power Company, New York.

Bence, Stevenson & McLorg, acting in behalf of the intending purchasers, have written to the City Commissioner as follows:

We have just received instructions from the Dominion Electric Light & Power Company, Inc., to ask if the city would consider favorably an offer to purchase the power plant, poles, wires, and all equipment accessory and incidental to the manufacture and distribution of light and power to the city of Saskatoon, together with the railway, which, of course, is inclusive of all equipment and property used in connection therewith, at and for the sum of $3,500,000 cash.

If an agreement is arrived at our clients are prepared to spend the further sum of $1,500,000 on development of electric power and light.

In making the above inquiries our clients have in mind that the present rates for power and light remain, that the usual depreciation continue and that a sinking fund therefore be provided out of earnings.

An interest rate on the money invested is to be allowed and the rate to be agreed upon by both parties. Our clients will pay taxes.

Net profits, after providing for the above, are to be divided equally between the city and our clients.

With further reference to the rates as stated above, the present rates would be maintained subject, of course, to mutual agreement otherwise.

A franchise that would satisfy the legal requirements would be required.

New Issues for Stark Electric Approved by Commission

A $500,000 first mortgage 7 per cent bond issue of the Stark Electric Railroad, Alliance, Ohio, to be sold at 90 and the issuance of $250,000 of preferred stock to finance the retirement of a twenty-year $730,000 mortgage and outstanding notes have been approved by the Public Utilities Commission. That body has also amended an order of Nov. 16 concerning the sale of electrical equipment by the Stark Electric to the Alliance Power Company. The amendment authorizes the power company to purchase an easement right-of-way from Louisville to Damascus, Ohio, a distance of about 16 miles, for $22,500.

Approval of Massachusetts Interurban Stock Issues

New capital stock issues by the Boston, Worcester & New York Street Railway have been approved by the Massachusetts Department of Public Utilities. The company has secured approval of an issue of 7 per cent prior preferred stock for $10,000 in $100 shares, and an issue of 6 per cent preferred stock for $756,000 in $100 shares in lieu of $766,000 of outstanding common capital stock. The names, preferences, rights, restrictions, limitations and rates determined by the stockholders on Dec. 3, as applicable to the new stock, are approved. The company succeeded the Boston & Worcester Street Railway.

Scope of Securities Association Widened

Primary purpose of national association is to provide for collective action to improve credit of issuing corporations. Objectives of body will now embrace public utility securities

IN ORDER that the 70,000,000 citizens whose interests are involved may have a voice in the activities of the new Congress toward railroads and public utilities, the National Association of Owners of Railroad Securities laid down recently a program for the expansion of its functions. It will for the first time provide a means through which these actual owners may help guide the destinies of their properties.

At a meeting at the Bowery Savings Bank, some 50 of the members of the advisory and executive committees of the association voted to change its name to "National Association of Owners of Railroad and Public Utility Securities" so as to provide a more comprehensive understanding of the original purpose of the association, when it was established in 1917.

The meeting was called by Milton W. Harrison, president of the association and a trustee of the Bowery Savings Bank. Policies enunciated on Nov. 29 as determining the purposes of the association will go far, it is believed, toward helping Congress in respect to its responsibilities in matters relating to railroad and public utility industries.

Outstanding among the purposes of the association are the following:

1. To provide a method for collective action by owners of railroad and other securities for the purpose of maintaining and improving the credit of the corporations issuing them.

2. To protect and assist in steps for stabilizing the securities issued by railroads and other public utilities of the United States.

3. To organize, promote and carry out, in the public interest, a campaign of education, that the public may be informed of the extent to which all citizens are directly interested in the welfare of public utilities and railroads, and in the securities issued by them. Also to point the necessity for collective action to protect investments made in railroad, public utility, and other securities, in order that the credit of such corporations may be maintained, resulting in a better and more economical service to the people.

Milton W. Harrison was re-elected president of the association. Henry Bruere, New York, was appointed treasurer, and the following were elected district vice-presidents: Darwin P. Kingsley, president New York Life Insurance Company; T. K. Glenn, president Trust Company of Georgia, Atlanta; M. A. Traylor, president First Trust & Savings Bank, Chicago; I. H. Kempner, president United States National Bank, Galveston, Tex., and George I. Cochrane, president Pacific Mutual Life Insurance Company, Los Angeles.

General offices of the association will be maintained at 11 East 36th Street, New York. The present membership of the association will be extended to include such further individual and institutional owners of railway and public utility securities as may care to avail themselves of the association's advantages.

In outlining the scope and purpose of the work in hand, President Harrison said:

Changing the name of the association, with objectives that embrace public utility securities as well, effectively carries out the reason for the establishment of the national association in 1917. Since that date holders of railroad securities have become extensive investors in public utilities.

At present Congress and the commissions undertake to represent the investors without the help of the investors themselves. It becomes, therefore, an obligation of nation-wide importance that investors effectively put themselves in a position not only to be of constructive assistance to Congress and to regulatory commissions but to protect and stabilize the securities they own. Unwise legislation and regulation can do much damage to the soundness of security values because the industries behind such securities are under government control.

This association is in the happy position of desiring only the application of sound economic principles. Our interests are wholly parallel with those of legislatures, courts and regulatory bodies. No organization is so favorably positioned as ours to perform constructive service. The identity of our interest with that of the public interest will be apparent to all. But let this be clearly understood, our views will carry no weight unless we enunciate them.

With regard to railroads, of great importance to our interest is the question of primary valuations. The I. C. C. methods have been earnestly protested by parties at issue and with the greatest divergence of opinion. Several attempts have been made by protestants to secure review by the Supreme Court but such petitions have been dismissed pending the time the commission seeks to make practical application of its valuation findings. Such court review will probably be had in the early months of 1928. It is of great importance to us that valuation principles and procedure are still in a formative state and are susceptible of being molded by Congress and by courts along lines radically different from those adopted by the commission.

There are almost daily before the Interstate Commerce Commission finance dockets involving the issuance or retirement of security issues with which we are most directly concerned. There are pronounced

Digitized by Google

indications that the commission is slowly evolving a policy on financial structures which will in the future be controlling upon it. We should certainly know how our interests are affected in these cases and be in a position effectively to intervene when necessary. The relation between valuation for rate making and for taxation should be more earnestly studied and we should, I believe, participate constructively to inform the public on this and similar matters.

Tax Assessment of Capital Stock Reduced in Chicago

Holding that the tax assessment on capital stock of the Chicago Surface Lines, Chicago, Ill., made by the Illinois Tax Commission "amounted to virtual confiscation," Judge Victor P. Arnold of the Circuit Court has reduced the amount from $2,192,145 to $1,181,547. In a decision handed down Dec. 19, the court stated that the commission evidently ignored its own rules by not reviewing available evidence concerning actual value of the stock. The suit was of importance because it involved the question of how far the State Tax Commission can go in assessing taxes on the capital stock of corporations. The decision sustains the contention of the Chicago Surface Lines in every respect. The tax as fixed by the State Tax Commission and as fixed by the court as fair is as follows:

Company	State Tax Commission	Circuit Court
Chicago Railways	$798,150	$494,099
Calumet & South Chicago*	629,690	262,335
Chicago City Railway	764,304	425,113
Totals	$2,192,145	$1,181,547

* The amounts are for the years 1925 and 1926, except in the case of the Calumet & South Chicago to which the year 1924 is added.

Partial Abandonments in Auburn

The Public Service Commission approved a declaration of abandonment by the Empire State Railroad Corporation on Dec. 5 of what is known as the Clark Street line in Auburn and the West Genesee Street tracks. It was decided that the lines were no longer necessary for the public use. The fact was brought out at the hearing before the commission that the Empire company, now in the hands of a receiver, owed Auburn for paving taxes $12,173.

Mitten Building Purchased

The Mitten Bank Securities Corporation recently purchased from Mitten Management the Mitten Building, located at the northwest corner of Broad and Locust Streets, Philadelphia. The purchase price was $6,000,000, the same amount paid by Mitten Management when it bought the property. This building, with twenty floors, is one of the newest and most modern office structures in the central district. The first thirteen floors are occupied for the most part by Mitten Management and the offices of the Philadelphia Rapid Transit, while the Mitten tours motor-bus terminal is located on the ground floor.

Personal Items

Omaha Welcomes Mr. Shannahan

New president is guest of honor at luncheon. Newspaper comment favorable and helpful in tone

JOHN N. SHANNAHAN, new president of the Omaha & Council Bluffs Street Railway, Omaha, Neb., was guest of honor on Dec. 19 at a luncheon by J. E. Davidson at the Fontenelle, Omaha. One hundred and fifty business men attended. He said in part:

To come to a city where I know almost no one and get a welcome like this makes my job look much easier than it did ten days ago, he began. I have never lived away from the Atlantic seaboard, and my friends told me they wondered why I came to Omaha. The reason the invitation appealed to me so strongly is this: The electric railway business of the country is in a particularly critical state at this time. If I can work out the situation satisfactorily here, give Omaha a transportation system it should have and put the company on a dividend basis—not only in dollars and cents but in good will and friendship—then possibly I will show my brothers in the industry the way out of their difficulties.

Realizes Difficulties of Job Ahead of Him

And this cannot be done without your assistance. I am conscious I have undertaken a difficult job. A railway is the servant of the public, and I regard myself as much of a servant as your mayor or the policeman on your streets. My aim is to make Omaha's railway an asset to the city. A dilapidated, "run down at the heel" railway system is the poorest advertisement a city can have. I want your suggestions, and the door of my office will always be open. If you think you can be of assistance, pay me a call.

Under the title "Welcome, Mr. Shannahan, the Omaha *World-Herald* of Dec. 20 said in part:

Mr. Shannahan has come to serve as president of the railway at a very troublesome and critical time in the history of that corporation. He comes with a shining record of success as a doctor of sick public utilities, due in part, it is said, to his technical competence and broad understanding of such problems, and in other part to an exceptional gift for winning public confidence and support by deserving to win it.

Newspapers Favorably Disposed

The *World-Herald* hopes that the new president may prove all that he is cracked up to be, and that he may achieve another notable success by putting the company back on its feet and by establishing a genuine entente cordiale between it and its patrons, the people of Omaha. And we should not be at all surprised if he does it, difficult though the task appears. For Mr. Shannahan impresses the stranger as a candid, fair-minded and straightforward man, at once earnest and tactful.

An executive such as he should need to go not much more than half-way to find that the most of his troubles are little ones, after all. For Omaha has no war to wage on the railway. Omaha wants to see it a successful and well-managed corporation, and is cheerfully willing that it should earn a fair profit on honest and prudent investment. At once for the company's good and for the city's good it is to be hoped that as much can be done for the railway as for other public service corporations. The *World-Herald* welcomes John Shannahan to Omaha not only as a railway executive but as a citizen, and hopes that his days among us may be long and pleasant and freighted with usefulness.

Clark V. Wood, Jr., Official of New England Transportation

Clark V. Wood, Jr., has been appointed assistant supervisor of the Connecticut lines of the New England Transportation Company, subsidiary of the New York, New Haven & Hartford Railroad. He has in the past been connected with the Springfield Street Railway and the United Electric Railways, Providence.

L. E. Lynde Transportation Division Manager at Boston

L. E. Lynde has been appointed manager of the transportation division of the Boston office of the Westinghouse Electric & Manufacturing Company. Mr. Lynde has been with the Westinghouse company since 1920, and during the past several years has been located in its New York office, where he was engaged in transportation activities.

Mr. Lynde was born in Dover, N. H. He was reared there and was graduated from the University of New Hampshire. He is a member of the New York Railroad Club, American Electric Railway Association and Theta Chi fraternity.

During the war Mr. Lynde served overseas as an officer with the A. E. F.

Mr. Lynde succeeds H. S. Day, who recently resigned to become superintendent of equipment for the United Electric Railways, Providence.

Joe R. Ong Studies Winnipeg System

Joe R. Ong, transportation engineer of the Cincinnati Street Railway, Cincinnati, Ohio, has just returned to Cincinnati from Winnipeg, Manitoba, where he has been engaged for several weeks as consultant on matters relating to the railway utility of the Winnipeg Electric Company.

Mr. Ong became connected with the Cincinnati Street Railway in February, 1926, shortly after its reorganization and is in charge of transportation engineering matters and the traffic studies

Digitized by Google

that are proceeding along with the rehabilitation of the property. He has been serving the Winnipeg company on a special leave of absence from the Cincinnati system.

Other railway properties with which Mr. Ong has been identified as transportation engineer or as consultant include the Georgia Power Company, Atlanta; the Kansas City Public Service Company, Kansas City, Mo.; the Los Angeles Railway and the Northern Ohio Power & Light Company, Akron. He was formerly electric railway engineer on the staff that served jointly the Railroad Commission of Wisconsin and the Wisconsin Tax Commission and conducted service studies and appraisals on many of the Wisconsin properties including the Milwaukee Electric Railway & Light Company.

W. Nelson Smith with Engineers

W. Nelson Smith, connected with the Winnipeg Electric Company, Winnipeg, Man., for some years and more recently assisting several prominent engineering firms on heavy electric traction projects, has become connected with the organization of the E. L. Phillipps & Company, engineers, 50 Church Street, New York, N. Y. Mr. Smith returned to Winnipeg in 1925 after an absence of about a year in Vancouver, where he assisted Sydney E. Junkins & Company, Ltd., in preparing a report on the electrification of the Canadian Pacific Railway. After his return he was engaged for a time in the valuation of the light and power distribution systems of the Winnipeg Electric Company. Mr. Smith's experience in steam railway electrification work covers a period of more than twenty years. After designing a number of interurban railway systems, he took a leading part in the laying out of the electrification of the Erie Railroad at Rochester, N. Y., and the Long Island Railroad.

Edison Medal Awarded to William D. Coolidge

The Edison Medal has been awarded by the Edison medal committee of the American Institute of Electrical Engineers to Dr. William D. Coolidge, "for his contributions to the incandescent electric lighting and the X-Ray arts."

The Edison Medal was founded by associates and friends of Thomas A. Edison, and is awarded annually for "meritorious achievement in electrical science, electrical engineering, or the electrical arts," by a committee consisting of 24 members of the American Institute of Electrical Engineers.

The medal has in the past been awarded to Elihu Thomson, Frank J. Sprague, George Westinghouse, William Stanley, Charles F. Brush, Alexander Graham Bell, Nikola Tesla, John J. Carty, Benjamin G. Lamme, W. L. R. Emmet, Michael I. Pupin, Cummings C. Chesney, Robert A. Millikan, John W. Lieb, John White Howell, Harris J. Ryan.

Dr. Coolidge is assistant director of the research laboratory in the General Electric Company, physical chemist.

OBITUARY

B. C. Edgar

Official of Tennessee utilities an executive of wide experience. Firm believer in value of good public relations

B. C. EDGAR, vice-president and general manager Tennessee Electric Power Company and president of the Nashville Railway & Light Company, died on Dec. 26 at his home on Lookout Mountain, Chattanooga, Tenn. Mr. Edgar, for many years prominent in the utility field for the important posts he filled so acceptably, had been ill for a long time.

Mr. Edgar was always a firm believer

B. C. Edgar

in the policy of maintaining good public relations and meriting the confidence of the utility's customers, and in giving complete publicity to the affairs of his companies through the daily newspapers and the weekly press of Tennessee. Under his guidance the local utility became one of the leading public service organizations of its kind, not only in the South, but throughout the nation, furnishing electric light and power service for more than 100 communities in Middle and East Tennessee.

He always took an active interest in the affairs of the electric light and power industry. In 1926-1927 Mr. Edgar served as president of the National Electric Light Association, southeastern division, comprising light and power companies and those identified or affiliated with the electrical industry in the states of North and South Carolina, Georgia, Florida, Alabama and Tennessee. He presided at the last convention of the association held in Memphis in April of this year.

Mr. Edgar was first employed by the Manhattan Railway, New York City, in changing from steam-driven trains to electrical operation. Later he became identified with the electrification of the tubes under the Hudson River at New York City.

From 1909 to 1912 he was in San Francisco and in Portland, Ore., with the Southern Pacific System. Among his task was one connected with the electrification of suburban railway lines from Oakland to Berkeley, Cal. From 1912 to June, 1914, Mr. Edgar was assistant general superintendent of the Columbus Railway, Power & Light Company, Columbus, Ohio. He was made general superintendent of the Nashville company in the latter year, and in February, 1919, he was elected to the vice-presidency of the Chattanooga Railway & Light Company, the Nashville Railway & Light Company and the Tennessee Power Company. When the Chattanooga Railway & Light Company and the Tennessee Power were merged in February, 1923, with the Chattanooga & Tennessee River Power Company into the Tennessee Electric Power Company Mr. Edgar was continued as vice-president and general manager of the merged company. In December, 1925, he became president of the Nashville company. Under his administration the Tennessee companies have grown greatly.

Mr. Edgar was born in Rahway, N. J., in 1878. In his early boyhood he became interested in the rapidly developing science of electricity. He was graduated in electrical engineering from Rutgers College, New Brunswick, N. J., in 1900.

WILLIAM G. MATTHEWS, superintendent of way and buildings of the Denver Tramway, Denver, Col., died Dec. 3. Mr. Matthews joined the tramway in 1891. At that time the system was run by cable. He worked in various departments up to 1920, when he was appointed maintenance superintendent, the position he filled up to the time of his death.

JOSEPH HORACE GOODSPEED, at one time affiliated with the West End Street Railway, the predecessor of the Boston Elevated Railway, Boston, Mass., died on Dec. 11.

J. PHILIP PHINIZY, a director of the Georgia Power Company, Atlanta, Ga., died recently at his residence in Athens. He was president of the Southern Manufacturing Company and president of the Southern Life Insurance Company. Mr. Phinizy was 66 years old. He was an alumnus of the University of Georgia.

CHARLES D. STANFORD, Maine capitalist, instrumental in the promotion of the electric railway in Bangor, Me., died Nov. 8 in Bangor. Years ago he foresaw the advantages of the electric railway and was one of the promoters of the Bangor Street Railway. He was also connected officially with the power developments of the Bangor Hydro-Electric Company, which controls most of the power developments and railways in that section. Mr. Stanford was 81 years old.

Digitized by Google

Manufactures and the Markets

Ten New Cars for New York, Westchester & Boston Railway

Ten electric passenger cars are being ordered by the New York, Westchester & Boston Railway, New York, N. Y.

The car bodies and trucks will be Osgood-Bradley, electrical equipment Westinghouse Electric & Manufacturing Company and air brakes Westinghouse Air Brake Company.

The units, it is understood, will be similar in design to the twenty cars previously ordered and mentioned in the JOURNAL for Aug. 21, 1926. The latter have an overall length of 72 ft. 7¼ in. and seat 80 passengers.

The new cars will be delivered in the spring and will be used on the extension under construction between Harrison and Rye, N. Y.

Westinghouse Veteran Promoted

I. F. Baker has been promoted to manager of the Far Eastern department of the Westinghouse International Company. He comes to his new position from Japan, where he was managing director of the Westinghouse Electric Company of Japan, president of the American Merchants Association of Tokio, and acting president of the American Association of Tokio. His new offices will be in New York.

Mr. Baker is a veteran in the Westinghouse company. He entered the company as an apprentice in 1909, graduating into the industrial sales department, East Pittsburgh, in 1910; was transferred to the Westinghouse Electric Export Company at East Pittsburgh in 1913; was made commercial engineer in the Westinghouse Electric International Company of New York, in 1918, and sent to Tokio, Japan, as a manager for Japan in 1919. Six years later he was promoted to managing director of the Japan Company, which position he held until his recent transfer to New York.

New Viaduct to Eliminate Grade Crossing in East St. Louis

The grade crossing of the Terminal Railroad Association and the East St. Louis & Suburban Railway at 21st and State Streets, East St. Louis, Ill., it is reported will be eliminated by the construction of a reinforced concrete viaduct to carry the railroad tracks above State Street, which will be depressed from 6 to 8 ft. Detailed plans have not been prepared, but the project will cost about $300,000. The cost, it is understood, will be shared by the Terminal, the East St. Louis & Suburban and the city.

Originally it was planned to construct a similar viaduct to eliminate the Southern Railroad belt grade crossing two blocks away, but the special committee on grade crossing separation appointed by the East St. Louis Chamber of Commerce and the representatives of the railroads and city officials decided to compromise by constructing only the terminal viaduct at this time.

It is planned to depress State Street from 6 to 8 ft. and to elevate the terminal tracks about 10 ft. above the present level.

Big Motor Order Placed by London Underground

An order for twenty new steel motor motors, each of 240 hp., has been placed by the London Underground Railways with the General Electric Company. The order also includes equipment for 63 motor coaches and 107 trailer cars. Six hundred and twenty-eight coaches of the London Underground system have been similarly equipped by the same concern. The new order, according to reports, is the first part of the complete overhauling scheme recently initiated by the London Underground.

Twenty Motor and Trail Cars for Illinois Central

An order for twenty new steel motors and trailer passenger cars for use in its electrified Chicago suburban service was placed Dec. 24 with the Pullman Car & Manufacturing Corporation, Chicago, by the Illinois Central Railroad, Chicago, Ill. The new cars, seating 84 passengers each and all equipped with roller bearings, increase the company's electrically operated equipment to 280 units. Delivery of the cars, which are estimated to cost between $900,000 and $1,000,000, is promised for 1928.

Five Railways and Subsidiaries Receive Mack Buses

Deliveries of Mack buses to electric railways and their bus operating subsidiaries recently reported by the International Motor Company's bus department follow:

Utah Light & Traction Company, Salt Lake City, Utah, has received five Mack bus chassis, two 230-in. wheelbase and three 196-in. wheelbase.

Hamburg Railway, Hamburg, N. Y., operating an extension bus line from its city limits terminal into Buffalo, has received a Mack bus, a 25-passenger parlor car bus, 230-in. wheelbase, four-cylinder motor, for de luxe service.

Boston Elevated Railway, Boston, Mass., has accepted delivery on two Mack buses, city type, 29-passenger capacity, four-cylinder motors.

Connecticut Company, New Haven, Conn., has accepted delivery on five 29-passenger city type Mack buses, four-cylinder motor, 225-in. wheelbase.

Public Service Transportation Company, bus operating subsidiary of the Public Service Corporation of New Jersey, Newark, N. J., has received three Mack parlor car buses, 25-passenger capacity, 230-in. wheelbase, four-cylinder motor.

Expansion Program in Los Angeles Not Yet Determined

Not until the California Railroad Commission hands down its decision in the case affecting rates on the Los Angeles Railway, Los Angeles, Cal., will the company be in a position to determine in detail the program for expansion which it is understood to have in mind. The hearing in the rate case was held last May, but the commission has not yet acted upon the appeal made to it. The company is not now in a position to add any more cars of the so-called 2501 type, and it will, it is understood, continue with its present rolling stock equipment until such time as the commission has rendered its decision.

New Pension Plan Announced by General Electric

A contributory pension plan, whereby employees pay in a small part of their wages from year to year to a pension fund, supplementing the old age pension system which the General Electric Company has had in effect since 1912, has been announced by Gerard Swope, president of the company.

At the same time Mr. Swope announced the creation of a pension trust. Instead of the company carrying a reserve on its balance sheet sufficient to meet its obligation to employees reaching the retiring age, $5,000,000 has been turned over to the trustees of the new trust by the company.

Pensions at present are computed at 1½ per cent of the earnings of employees for each year of continuous service. Under contributory plan of additional pensions, which it is proposed to make effective Jan. 1, 1929, 1½ per cent of the annual earnings of the employees will be turned over to the custodians, a board of seven, on which the employees will have representation. This money will be invested and held for the employees individually. Interest will be allowed to accumulate.

The retiring age in the past has been 70 years for men. Under the new plan it is proposed to make this 65 years for men and, as at present, 60 years for women.

N.Y.R.T. Gets 600-Volt, 4,000-Kw. Converter

The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has recently furnished to the New York Rapid Transit Company a 4,000-kw., 600-volt converter which is a dupli-

Digitized by Google

cate of a machine already installed in the same station. The new machine is a 4,000-kw., 575-volt, direct-current, shunt-wound converter. It is supplied from a three-phase, 4,200-kva., 11,000-volt, 25-cycle power transformer. The equipment is operated by means of supervisory control from the New Utrecht station.

$2,578,296 for Kansas City Rehabilitation Program

The budget of $2,578,296 for completion of the rehabilitation program of 1928 of the Kansas City Public Service Company, Kansas City, Mo., has been submitted to Dr. Saunders, of the executive committee and his associate members, Powell C. Groner, president of the company, and Col. E. M. Stayton, city representative. It includes $1,018,180 for overhauling and rebuilding cars, $933,228 for new tracks, and $240,588 for special track work at intersections. The committee will report to the directors at a meeting to be held within a few days.

The franchise promised a rehabilitation program of $6,600,000 to be finished within three years. Last year under the regime of William G. Woolfolk as president, expenditures approximating $4,000,000 were authorized and for the most part completed.

Montreal Tramways and City Decide on Car Tunnel

The city of Montreal and the Montreal Tramways, according to reports, have decided to tunnel under the Lachine Canal on Wellington Street, the work to cost between $7,000,000 and $8,000,000. In a recent interview Julian Smith, president of the tramways company, stated that as a result of long-continued negotiation with the city an agreement had been arrived at between the city of Montreal and the tramway. The project has now been given the approval of the Tramways Commission, subject to the approval of the Dominion government and subject to contribution by the Dominion government toward the expense of the work of putting the tramway lines on Wellington Street and Verdun Avenue into tunnels beneath the canal and building new lines so that through cars could be operated from St. Catherine Street into Verdun and Pointe St. Charles.

With the construction of the tunnel under the canal on Wellington Street the Wellington Street service will be greatly improved and the long delays which have been due to the bridges will be eliminated, and a substantial gain in reducing delays to shipping will also result.

Negotiations are now taking place with the Dominion government looking to their approval, in principle, of this undertaking and to an agreement by which the government will bear its share of the expense. Advices are to the effect that it is hoped if the government comes to a prompt decision in this matter the work can be commenced on one of these undertakings and completed before the opening of navigation in 1928.

Good News

The 47th A. E. R. A. convention and exhibit are to be held in

Cleveland

Sept. 22-28, inclusive

Let your New Year resolution be to stage an exhibit at the next A. E. R. A. convention. That's the place to talk turkey.

Quiet and Steady Metal Markets

The customary and expected holiday quietness characterizes the metal markets for the week ended Dec. 28, and no change is expected until after New Year's Day. Prices, however, have been steady.

The large producing interests have continued to quote 14⅛ cents for domestic deliveries of copper in the East all week. A fair amount of business was done in the Middle West Dec. 23 at 14¼ cents, however. The custom smelters have in general quoted 14 cents delivered in Connecticut, since Dec. 22, when the last of the 13⅞ cents copper was absorbed. The price of the export association continues at 14.50 cents, c.i.f.

The leading interest in the Middle West quoted lead 6.325 cents all week, but business done at this figure was all but negligible, virtually all the sales by this company being on an "average" price basis. Other sellers did a fair business at 6.30 cents.

Some zinc has found a market at 5.625 cents in the week ended Dec. 28, but the price to consumers has generally ruled at 5.65 cents, St. Louis, for all deliveries. High-grade is neglected, with nominal quotations for spot carloads remaining at 7¾ cents delivered.

Tin prices are a little lower than they were a week ago. Straits suffered more than 99 per cent metal and the spread between the two today is only ⅛ cent. Compared with spot Straits, January and February are off about ⅛ cent, and March and April about ¼ cent.

TRADE NOTES

LINCOLN ELECTRIC COMPANY, Cleveland, Ohio, announces the appointment of R. M. Plympton as salesman in charge of consumer motor business in Chicago. He will work under the direction of R. D. Malm, Chicago district manager. Mr. Plympton was formerly assistant sales manager for the Babson Statistical Association, Wellesley Hills, Mass.

MANNING, MAXWELL & MOORE, INC., New York, to co-ordinate the handling of its business, has organized two operating companies under the laws of Delaware, the Consolidated-Ashcroft-Hancock Company and the Shaw Crane-Putnam Machine Company. Manning, Maxwell & Moore, Inc., owns all the stock of both corporations. The Bridgeport and the Boston plants of Manning, Maxwell & Moore, Inc., and the sales force marketing the products of these plants will make up the Consolidated-Ashcroft-Hancock Company. The Shaw Crane-Putnam Machine Company takes over the Shaw Crane Works and the Putnam Machine Works and the sales activities pertaining to them. The supplies department and the Chicago machinery branch office of Manning, Maxwell & Moore, Inc., operate as formerly.

RAILWAY TRACK-WORK COMPANY, Philadelphia, Pa., has sold to the Tulsa Street Railway, Tulsa, Okla., a "Vulcan" rail grinder and a "Eureka" rail joint grinder.

OHIO BRASS COMPANY, Mansfield, Ohio, has published booklet No. 519, entitled "The Dirge of a Dime (Ten Cents)." It contains amusing illustrations and text.

TRUSCON LABORATORIES, Detroit, Mich., has issued a folder descriptive of its products for the protection of steel, concrete and masonry, and wood.

WAGNER ELECTRIC CORPORATION, St. Louis, Mo., has issued bulletin No. 153, loose-leaf, describing the Wagner split-phase induction motor, type 58RB, ½, ⅓ and ¼ hp.

SILENT HOIST WINCH & CRANE COMPANY, INC., Brooklyn, N. Y., has issued bulletin No. 30, descriptive of its different types of silent hoist motor truck and power winches.

SULLIVAN MACHINERY COMPANY, Chicago, has recently issued looseleaf bulletin 81-O and 81-Q, descriptive of its auger rotators, class "H-8," and "rotator" rock drills, "L-5" medium, "L-3" heavy model. Both of the bulletins are illustrated.

What Are the Prospects for 1928?

NOW that the old year draws to a close everyone's attention is focused on the question of what 1928 holds in store. This is the season when prognosticators reach the zenith of their activity. Their past mistakes have been dimmed by the charitable hand of time and there is as yet no way of checking the accuracy of their predictions for the future.

After all, fate is inexorable and the pages of the book of time are closed to human eyes. Expression of opinion as to what the future holds in store is worthless, except in so far as it is limited to an analysis of trends and probabilities based upon accumulated experience.

Look to the Annual Statistical Number of the JOURNAL, which will be dated Jan. 14, for the facts regarding the industry's trends. There also you will find a forecast of activity in 1928, based not on opinion, but upon the industry's budget estimated from the figures supplied by operating companies that co-operate in the preparation of this issue.

Fageol Twin Coach of the Pittsburgh Motor Coach Company. The Twin Coach as well as many other modern coaches is furnished with the Westinghouse Automotive Air Brake, as standard equipment.

More Air Braked Coaches for Pittsburgh

PERHAPS in no other city are coach operating conditions more severe. Heavy traffic congestion, long hard hills, and unusual competition for the right of way have made the Air Brake a necessity.

The Westinghouse Air Brake is not new to Pittsburgh. For the past several years, the Pittsburgh Motor Coach Company has operated various makes of motor vehicles, including White, Fageol, Safeway, and by recent delivery several Fageol Twin Coaches, also Westinghouse Automotive Air Brake equipped. With this array of equipment, under modern brake control, the Pittsburgh Motor Coach Company has been able to set and maintain perfect schedules in spite of the conditions under which they serve.

This is just one instance in which the Westinghouse Air Brake has played an auspicious part . . . A representative from any of our conveniently located offices will be glad to tell you of others and go over your braking problems with you . . . without obligation of course.

Hold your place in traffic lanes, get the benefits of your full speed and power, relieve drivers from undue physical exertion, protect your equipment from strain caused by unequal applications . . . modernize with the Westinghouse Automotive Air Brake.

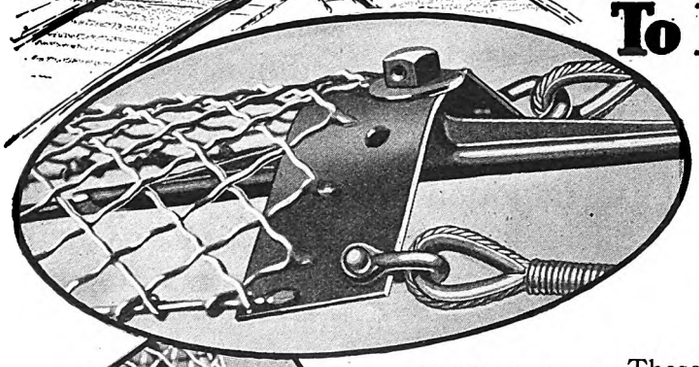
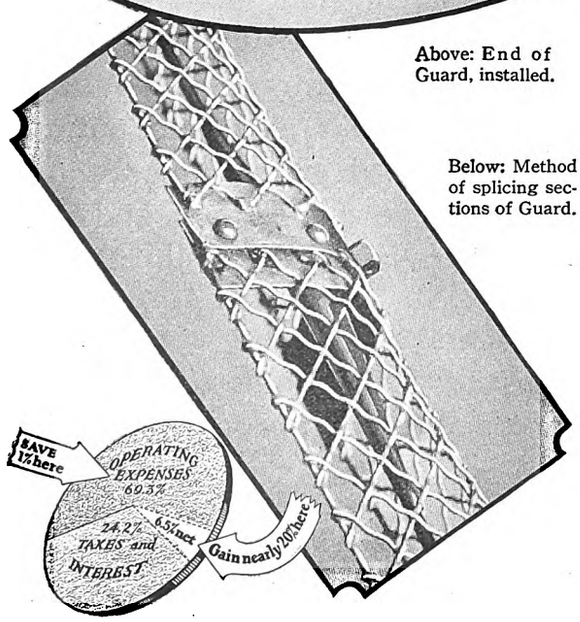
DOLLARS AND SENSE!

Add "Safety Crossings" To 1928 Improvements!



Above: End of Guard, installed.



Below: Method of splicing sections of Guard.

Service betterment, on which increased revenue depends, involves more than just major improvements in the design of cars. Detail improvements in operation and minor items of overhead equipment are equally important. "Safety Crossings" are among these minor improvements that loom large in making better service a fact.

YOU gain more than protection against dewirements, stalled cars, and possible serious accidents, when you make dangerous railroad crossings "Safety Crossings" with the installation of O-B Trolley Guard. Goodwill, faster schedules, and lower operating expense are additional rewards.

These important advantages follow because the installation of Trolley Guard shows a consideration for the car rider's safety and comfort that is not unnoticed; and because such installations prevent delays and save time at railroad crossings, thus speeding up schedules and reducing operating expenses.

The low initial cost of Trolley Guard—now 20% less than a year ago—makes its advantages available to every electric railway. And since Trolley Guard is made in 10-ft. sections, installation and maintenance expense is also lower today. For the new 10-ft. sections make it unnecessary to form the Guard on the job and to put it up in one long unwieldly piece. Formed at the factory before shipment, the Guard reaches you with yokes and end-plates attached, ready to hang.

Considering all these advantages of Trolley Guard, its cost is a small premium to pay for the large return on the investment. Therefore "Safety Crossings" may well be placed near the top of your list of improvements planned for 1928. For complete particulars address

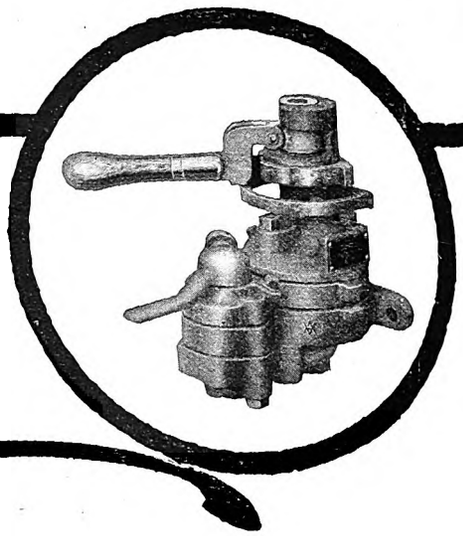
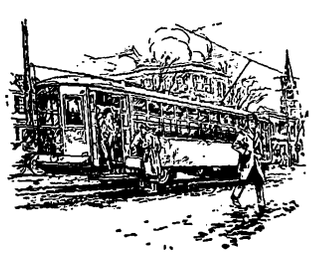
Interlocking brakes and doors by means of the M-28 Brake Valve with selective control, increases safety and convenience



Giving Impetus to Transportation Service



SPEEDY transportation is vital to present-day conditions. Car riders want it; car owners need it.

An important factor in the realization of this objective is the Safety Car Control Equipment. It brings economic advantages that warrant additional cars . . . assures the quickest possible brake action . . . provides maximum convenience and flexibility in controlling entrance and exit . . . safeguards operation by interlocking power, brakes, and doors and by centralizing responsibility.

Safety Cars are giving a noteworthy impetus to transportation service on hundreds of traction properties.

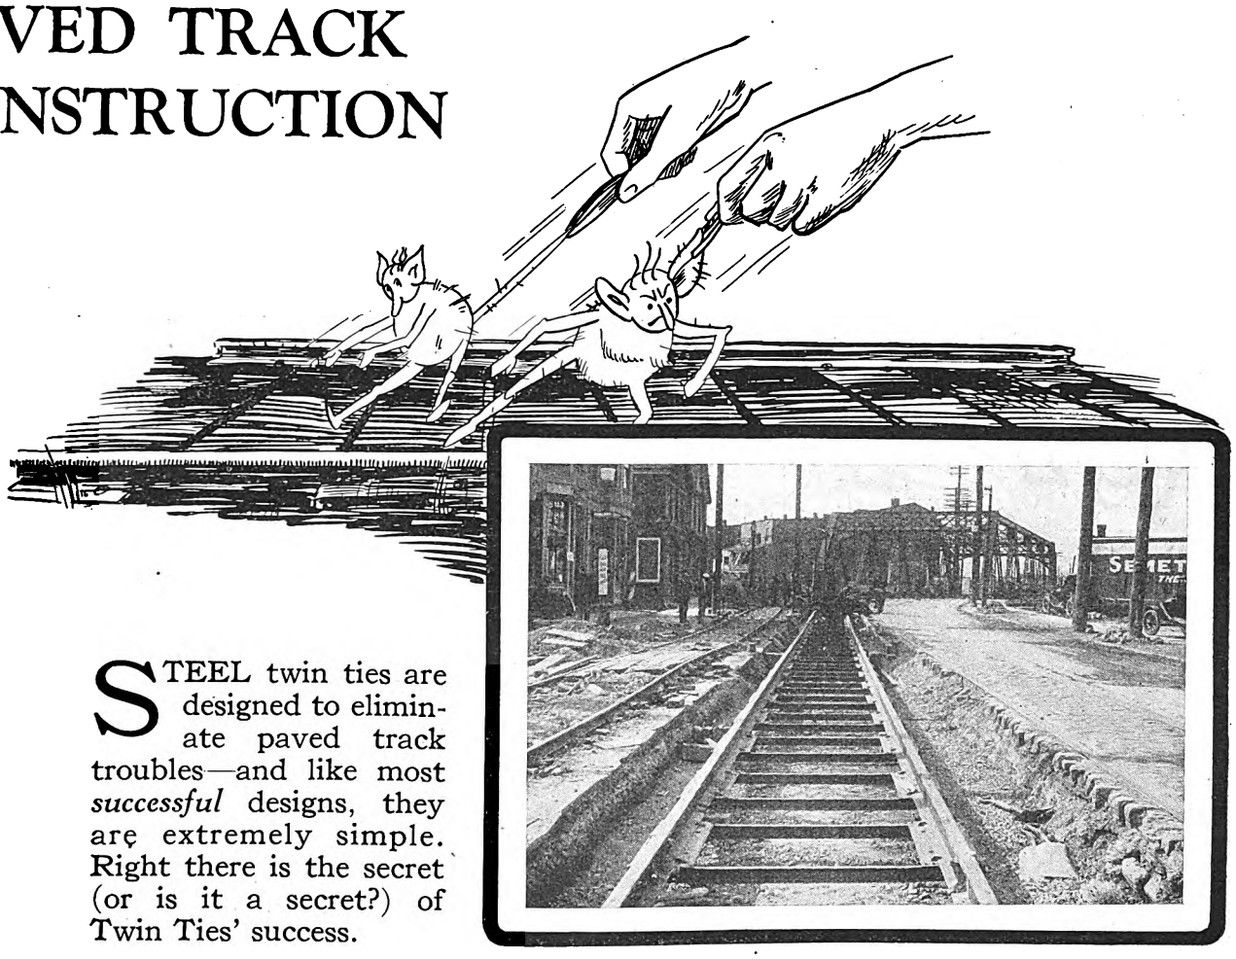
TAKING THE BUGS OUT OF PAVED TRACK CONSTRUCTION



STEEL twin ties are designed to eliminate paved track troubles—and like most *successful* designs, they are extremely simple. Right there is the secret (or is it a secret?) of Twin Ties' success.

Steel Twin Ties on Seneca St., Buffalo

And in eliminating such maintenance problems as spreading rails, rotted ties, pavement breakdowns, weakened joints, cracked foundations and the like, we have added many strengthening features. Twin ties become as much a part of the foundation as the concrete itself.

Add to all this the initial economy of using Steel Twin Ties and there is but one course to follow in planning your 1928 extension or rehabilitation campaign.

Write today for delivered prices.

In the "Good Old Days"

and To-day:

Many a wreck was made of the overhead system when a trolley pole jumped the wire. For there'd be a resounding smack and the wire would come tumbling down. And what the motorman said was never fit to print. Not to mention the cost to the company in tied up service, repair bills and other items that eat into profits.

There's no such trouble nowadays when Keystone Trolley Catchers are used. They catch the pole with the speed and precision that a baseball catcher picks off a foul tip. The only delay is the minute the motorman takes to put the trolley back on the wire.

Other items that cut down costs and sell more rides are fully described and illustrated in Catalog No. 7. Write us for your copy.

Keystone Trolley Catchers

Trolley catchers are for use on railway cars to "catch" the trolley pole when it leaves the wire. Their construction enables these catchers to "catch" the pole an instant after it "flies," saving the "banging" of the overhead structure and the resulting wear and tear and expense involved for repairs and delays in service.

DANBURY - CONN.

DANBURY was faced with a serious transportation problem—a problem that finds its duplicate elsewhere. Street car patronage was constantly declining. Track and rolling stock were in bad condition and the operating company could not hold their patronage because they could not sell transportation. Financial conditions made it impossible to rehabilitate.

In 1924, A. William Sperry, transportation and managing engineer, was employed by the bond holders' committees to examine the property and make recommendations for improving service. On November 19, 1926, the company was reorganized and Mr. Sperry was made Vice President and Manager with instructions to carry out the recommendations he had suggested. Shortly thereafter, street car service was abandoned and a 100 per cent motor coach operation, using Yellow Coaches, was effected. The substitution was complete. Since then, not a street car wheel has turned in Danbury.

Operating expenses decreased 27%
Net income increased 267%
Investment decreased 70%

And the Danbury Power & Transportation Company owns outright their garage, repair shop and offices and have properly included organization expense in their investment account.

Today, after thorough test and comparison, the operation shows—

That all passenger requirements in a normal American factory city of 30,000 can be successfully and profitably met by motor coaches, and in this case, without change in normal street car fare.

That in such a city, motor coach operation requires less than one-third the investment necessary for street car operation.

That a well managed but financially unsuccessful street car operation can be completely replaced by motor coach service and earn a satisfactory profit.

That efficient, up-to-date management, equipment of proper capacity and construction and carefully planned maintenance work will win public approval and gratifying financial results.

That a completely motorized service permits the serving of sparsely settled territory not formerly reached by street car service and the absorption of the losses incurred in such service.

Danbury rush hour demands are the same as in any normal factory city of comparable size. Street paving conditions were unusually good in-so-far as the street car company was concerned and much of the track was laid in the open between two paved lanes.

They did it in Danbury! "And how" is shown on the next page.

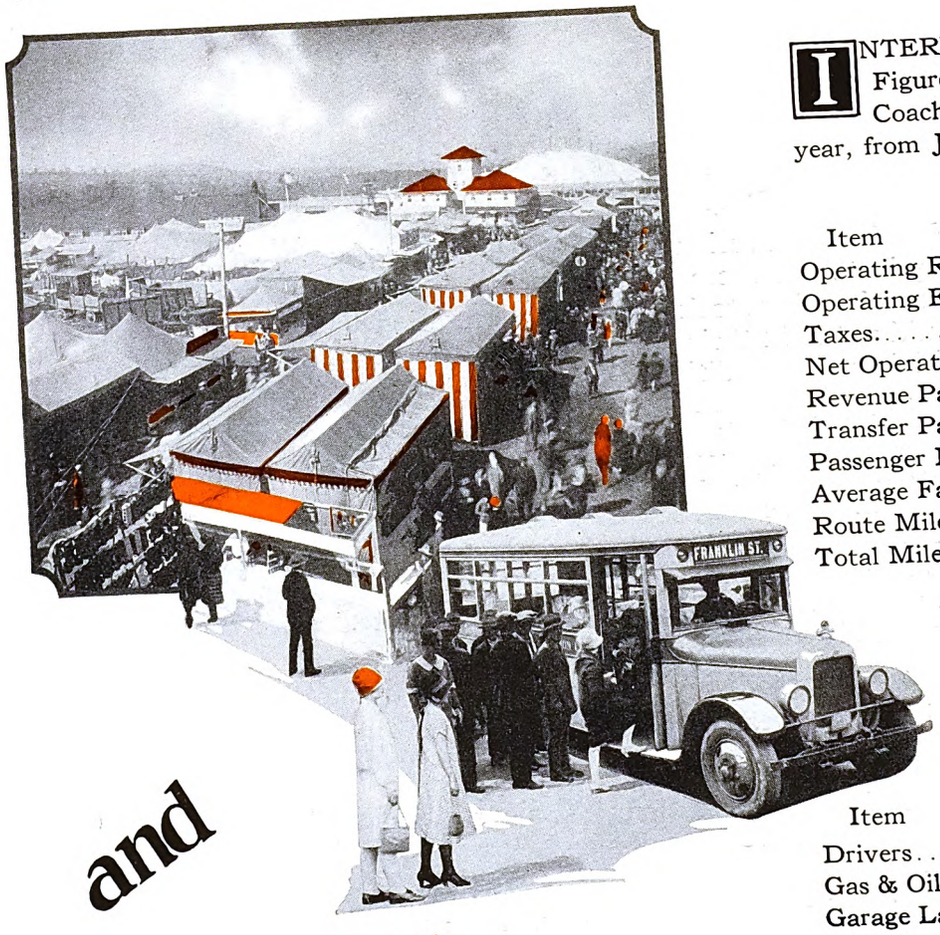
figures that talk



and

at the DANBURY FAIR

Every year, in October, Danbury has a Fair, held on the outskirts of the city. During Fair Week, the population of Danbury is increased 75%.

Formerly, the street car line running to the Fair grounds was woefully inadequate to carry the crowds. This year, Yellow Coaches handled the demands of mass transportation without a hitch. During the rush periods, Yellow Coaches left the Fair grounds on a schedule of less than three minutes without interrupting regular service. From a normal daily passenger carriage of approximately 3,900 on all lines, over 9,304 people were carried during one day of the Fair. And during the entire week, with every unit for equipment in constant use, there was only one case of mechanical trouble for the entire fleet.

INTERESTING Revenue and Statistical Figures covering the operation of Yellow Coaches for the first nine months of this year, from January 1 to September 30.

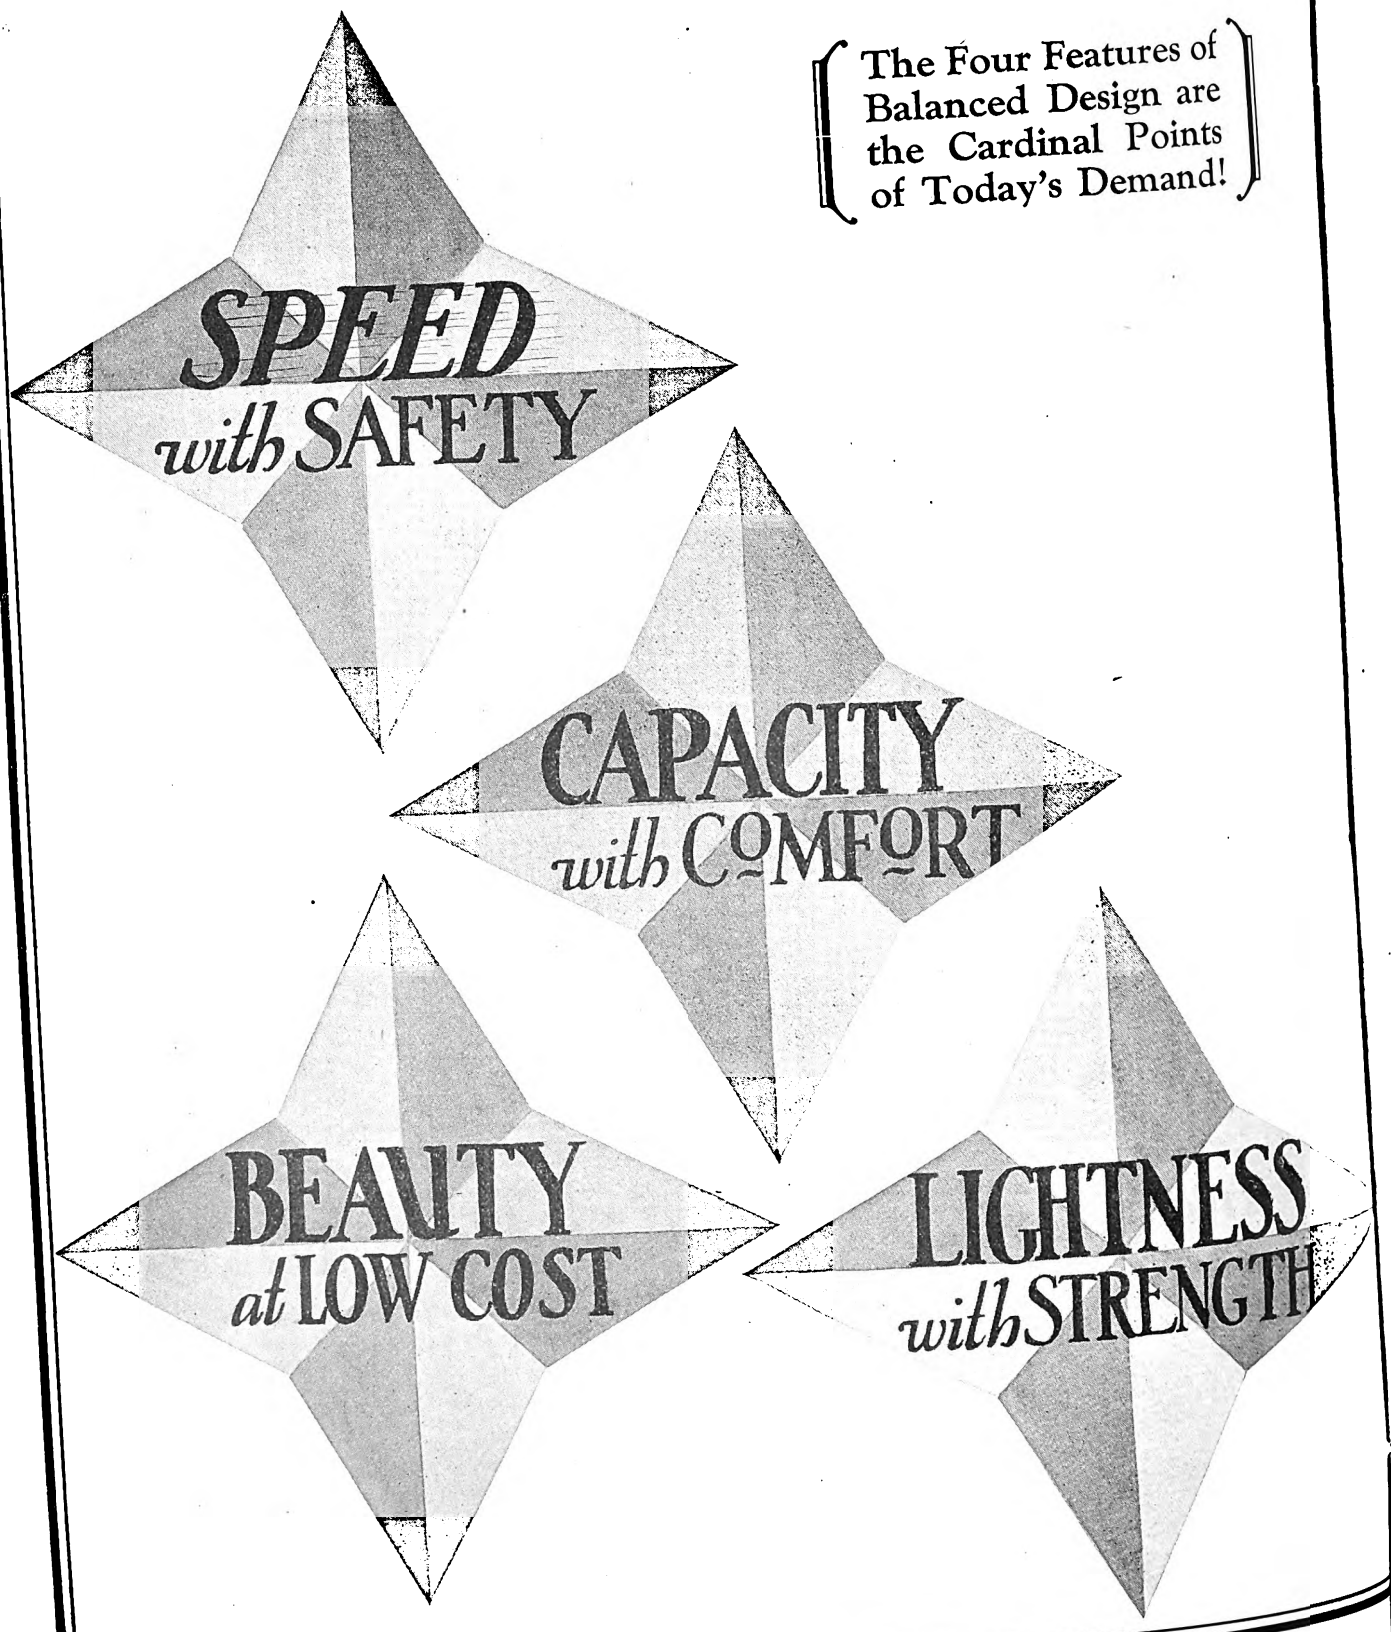
Building or mere

The Four Features of Balanced Design are the Cardinal Points of Today's Demand!



Digitized by Google

ly rebuilding?

The difference is important to future-minded electric railway operators. The one implies leadership, the other an effort to "follow the crowd."

We of the Cincinnati Car Company are earnestly endeavoring to build a leadership standard into the electric car of today and tomorrow.

We have established a principle of car-building,—BALANCED LIGHTWEIGHT DESIGN,—which brings every step in the building of the modern car under one thoroughly competent supervision.

We have capitalized long truck building experience to develop three of the most advanced types, at present available, the Cincinnati Lightweight City-type Truck, the Cincinnati Lightweight High-Speed Interurban-Truck, and the Cincinnati Cast Aluminum Frame Worm-Drive Truck.

We have developed and perfected the Duplex Air and Magnetic Brake for both city and interurban service. Furthermore we have installed in our plant the most efficient low-cost "mass production" machinery.

If you too, as an operator, are interested in *building* rather than rebuilding, we can work together to our mutual benefit. Bear in mind that every installation of Cincinnati NEW Lightweight Cars made to date has been successful.

Cincinnati Car Company, Cincinnati, Ohio

CINCINNATI BALANCED LIGHTWEIGHT CARS

—still a step ahead of the modern trend

Digitized by Google

These deluxe single-truck cars increased revenue 7% in eight months

—in Jamestown, N. Y.

With good track, the light-weight, one-man, single truck, safety car is without competition in economical transportation.

That cars of this type, whose greatest utility is confined to cities of less than 100,000 population where automobiles make greatest inroads on operating revenue, should meet transportation needs profitably is a remarkable tribute to the industry.

The Jamestown Street Railway, Jamestown, N. Y., had faith in such cars—products of the Quality Shops—and increased revenue 7% in eight months—and this in spite of the increased first cost of de luxe equipment.

Digitized by Google

The foresight of Jamestown is the hind sight of many operators—give the public the comfort they demand and they'll "come again."

There's a steady welcome jingle in the fare boxes of St. Louis cars.

St. Louis Car Co.

Quality Cars

Ten Semi-Steel Cars Being Built for Boston Elveated

The ten cars ordered by the Boston Elevated Railway, Boston, Mass., on Aug. 3 from the Laconia Car Company, Laconia, N. H., as announced in the Aug. 20 issue of the JOURNAL, are to be delivered during the 40-day period between Dec. 1, 1927, and Jan. 10, 1928. They are to be placed in service in South Boston and will replace the old box cars now in use there.

The cars, with a seating capacity of 48, are being built at a cost of approximately $12,000 each. They are of the one-man, two-man, double-end, double-truck type, having a total weight of 31,460 lb. and a length over all of 45 ft. 0 in. The body is of semi-steel construction with end doors and has an arch roof. The seating arrangement includes four longitudinal and sixteen cross seats, with a spacing of 29⅝ in. The painting scheme is to be yellow.

Operating equipment includes four G.E. 264-A inside-hung motors, G.E. K-71 control and Westinghouse air brakes with variable load attachment.

The official specifications are as follows:

No. of units	10
Type of unit	One-man, two-man, motor, passenger, city, double end, double truck
Seating capacity	48
Builder of car body	Laconia Car Company
Date of order	August 3, 1927
Date of delivery	Dec. 1, 1927, to Jan. 10, 1928
Weights:	
Car body	13,800 lb.
Trucks	8,700 lb.
Equipment	8,960 lb.
Total	31,460 lb.
Bolster centers	20 ft. 9 in.
Length over all	45 ft. 0 in.
Length over body posts	30 ft. 11½ in.
Truck wheelbase	5 ft. 2 in.
Width over all	8 ft. 6½ in.
Height, rail to trolley base	10 ft. 7½ in.
Window posts spacing	31½ in.
Body	Semi-steel
Roof	Arch
Doors	End, folding
Air brakes	Westinghouse, variable load attachment
Armature bearings	Plain
Axles	Pittsburgh Forge & Iron Company
Compressors	DH-16
Conduit	Flexibe
Control	General Electric K-71
Couplers	Malleable iron sleeve
Destination signs	Keystone
Door mechanism	National Pneumatic Company
Energy-saving device	Railway Improvement Co.
Fare boxes	Johnson
Finish	Flood-Conklin
Floor covering	Wood
Gears and pinions	General Electric spur
Glass	Double thick
Hand brakes	National staffless
Hand straps	Rico
Heat insulating material	Salamander
Heaters	Consolidated Car Heating Company
Headlights	Derssel
Headlining	Bronze and malleable iron
Journal bearings	Plain
Journal boxes	Steel castings
Lamp fixtures	Weber No. 61000
Motors	Four General Electric 26-A, inside hung
Registers	International single
Roof material	Wood and canvas
Seats	J. G. Brill Co.—4 longitudinal
Seat spacing	29⅝ in.
Seating material	Wood slat
Slack adjusters	M-1
Steps	Folding
Step treads	Wood universal tread nosing
Trolley catchers	Earll
Trolley base	Ohio Brass
Trucks	Taylor, type LRH
Ventilators	Garland
Wheels, type	Steel, 26-in. diameter
Wheelguards	Wood life guards on trucks

{ *Electric Railway Journal, October 8, 1927, page 722.* }

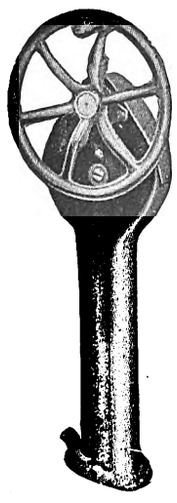
Ten more for the Boston "L" equipped with

"Peacock" Staffless Brakes

Reg. U. S. Pat. Off.

To replace the old box cars now in use in South Boston the Boston Elevated Railway has ordered ten one-man, two-man, double-end, double-truck type cars from the Laconia Car Company, Laconia, N. H., equipped with "Peacock" Staffless Brakes.

Whenever and wherever new cars are ordered, in every type of service, "Peacock" Staffless Brakes will usually be found in the specifications.



May we give you the reasons?

Studebaker

Announces a New Bus Chassis for fast Highway Service

High Speed Bus Chassis *by*

STUDEBAKER

Digitized by Google

MORE SPEED

With Less Weight

Studebaker Bus Models and Prices

"75" Model—184" wheelbase, dual rear wheels chassis only	$3275
21-Pass. Street Car Bus ("75" model chassis)	5895
"75" Special High Speed Chassis—184" wheelbase dual or single rear wheels (chassis only)	2775
9-Pass. Cross-Seat Sedan on "75" special chassis	5275
20-Pass. Parlor Car De Luxe on "75" special chassis	6395
22-Pass. Observation Parlor Car on "75" special chassis	6395
"75" Junior Model—158" wheelbase (chassis only)	2410
12-Pass. Cross-Seat Sedan on "75" Jr. chassis	4160
15-Pass. Cross-Seat Sedan ("75" Jr. chassis)	4520

All prices f. o. b. factory. Purchase can be arranged on Studebaker's liberal budget payment plan

Again Studebaker has produced a bus chassis which fully meets present day traffic conditions and the operator's requirements on long, fast schedules. This new "75" special high speed chassis has a wheelbase of 184 inches. It has 800 pounds less weight than the "75" heavy duty chassis. All "75" chassis because of recent motor refinements have greater power—the present Studebaker six-cylinder engine develops over 90 h.p. at 2600 r.p.m. The specially designed three speed forward transmission and rear axle with the more powerful motor and with less weight to carry, permit quicker acceleration, more speed on the road and greater economy of operation.

The same heavy, pressed steel frame and nine cross-members are retained, the same rugged type of construction is used throughout the entire chassis and body. At no point has there been any compromise with strength. Several new features have

The New Studebaker 75

Digitized by Google

—MORE POWER

and at Lower Cost

been incorporated. The engine has a high compression head; the generator is cooled with a centrifugal blower type fan; the specially designed rear axle is equipped with heavy bumper blocks which act as an auxiliary spring and bumper; the new double-face emergency brake operating on the propeller shaft is 14 inches in diameter.

The four-wheel mechanical brakes operate smoothly and easily, at 40 miles per hour to a full stop in 71 feet, or in 17 feet at 20 miles per hour. Notable ease of steering and a motor that is instantly responsive enables the driver to handle the Studebaker "75" high speed bus with the comfort and surety of a passenger car.

With these new features, less weight, greater power and lower cost, this new Studebaker "75" special high speed chassis offers a new conception of bus chassis value at $2775.

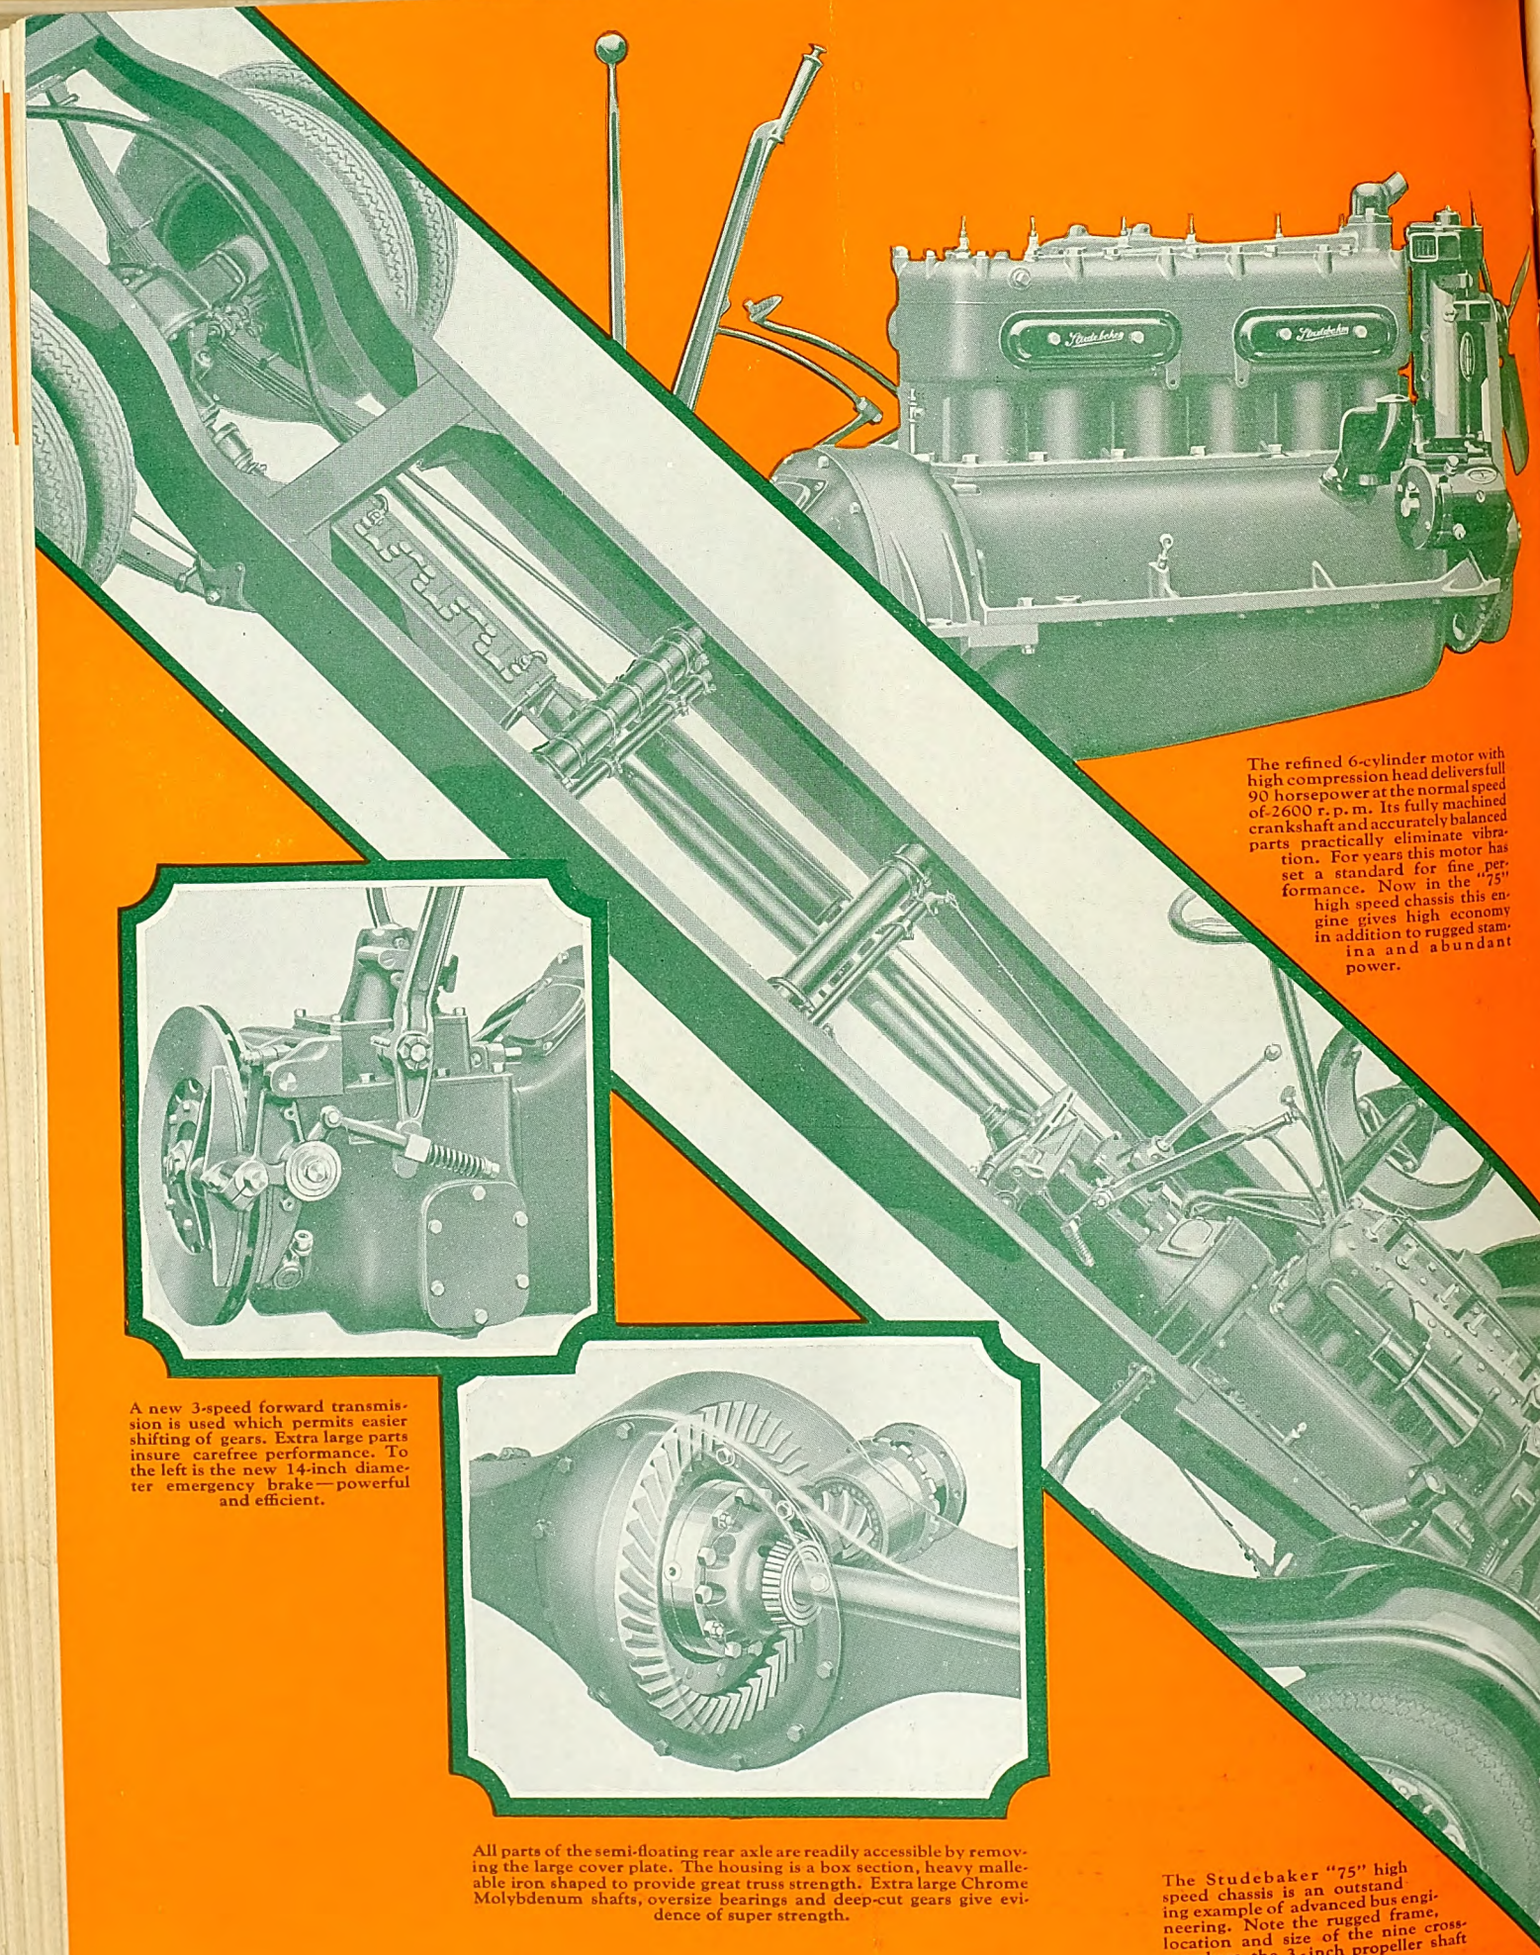
High Speed Bus Chassis

Digitized by Google



The refined 6-cylinder motor with high compression head delivers full 90 horsepower at the normal speed of 2600 r. p. m. Its fully machined crankshaft and accurately balanced parts practically eliminate vibration. For years this motor has set a standard for fine performance. Now in the "75" high speed chassis this engine gives high economy in addition to rugged stamina and abundant power.

A new 3-speed forward transmission is used which permits easier shifting of gears. Extra large parts insure carefree performance. To the left is the new 14-inch diameter emergency brake—powerful and efficient.

All parts of the semi-floating rear axle are readily accessible by removing the large cover plate. The housing is a box section, heavy malleable iron shaped to provide great truss strength. Extra large Chrome Molybdenum shafts, oversize bearings and deep-cut gears give evidence of super strength.

The Studebaker "75" high speed chassis is an outstanding example of advanced bus engineering. Note the rugged frame, location and size of the nine cross-members, the 3-inch propeller shaft and powerful rear axle.

The New Studebaker (75) ~~High Speed~~ Bus Chassis

Yes~ We Sell Dayton Ties To Friends

Selling Them Makes Friends

DAYTON MECHANICAL TIE COMPANY

DAYTON, OHIO

Yes—We Sell Dayton Ties to Friends

Because Selling Them Makes Friends, Our Repeat Orders Show It

We don't sell Dayton Ties to people because they are our friends—our customers are friends because we sell them Dayton Ties.

When electric railway officials get hold of something like Dayton Ties, which practically wipe out track maintenance they are naturally friendly—you can't blame them.

Dayton Ties do not merely obliterate track maintenance for a year or two, but for astonishing periods of years. Since their inception 16 years ago no track laid on Dayton Ties has ever failed.

Installations in 150 cities, under every kind of traffic the industry has to offer, meeting all kinds of adverse conditions—and not a failure. They continue to order—time after time.

Once you try Dayton Ties, you will be a friend, too.

Nuttall US 20-A Timken Roller Bearing Trolley Base

Grease 'er Twice a Year And Let 'er Go

You have smiled for years at the original feller in Coatesville who tells you to "Hook 'er to the Biler"—that's *amusement.*

But if you want to wear the smile of *genuine satisfaction,* and see that smile on every conductor's face—on every face around the car barn, here's a sure fire prescription:

Put on some Nuttall US 20-A Trolleys. It is literally true that you can lubricate them twice a year and forget them. They swivel on Timken Tapered Roller Bearings, and you know what they are. Every wearing part is hardened, and you can forget wear. Heavy shunts conduct the current around bearings and moving parts, so you can forget arcing troubles. All in all, what could be sweeter?

We buy entire Railways and Power Plants

H. E. SALZBERG COMPANY, Inc.

225 Broadway New York City

We sell Street Railway and Power equipment

Don't Say, "*It isn't worth anything*"

THAT surplus Used Equipment you have lying around the shop or yard can be turned into cash! The fact that it is of no further value to you doesn't mean it isn't of value to somebody else. There's always a market for used equipment. Reach the greatest number of prospective buyers for the surplus equipment you have, at a minimum cost, thru an advertisement in the—

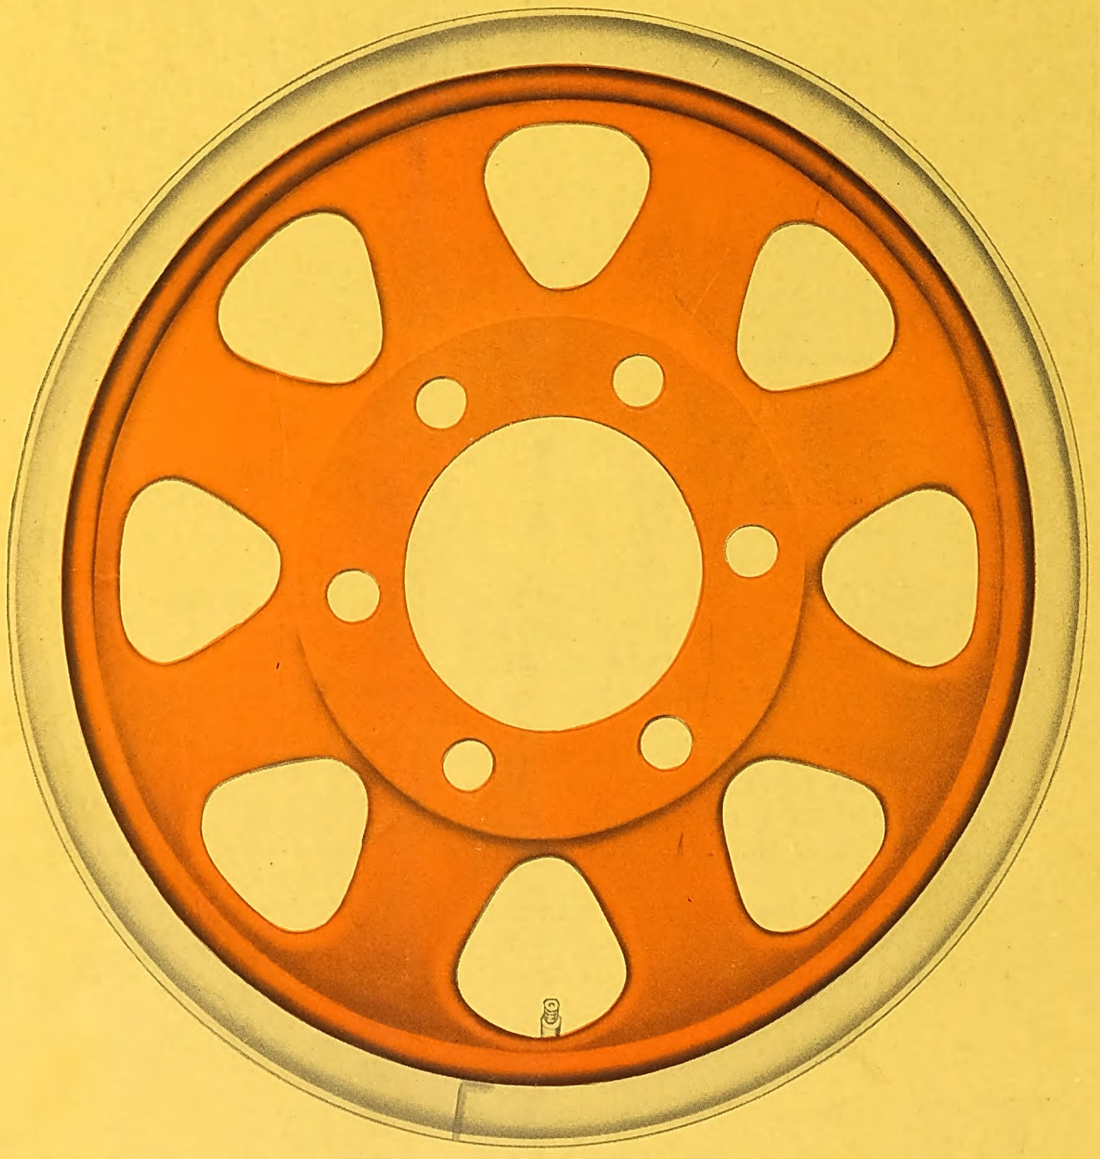
Motor Wheel PRODUCTS

Spoksteel



DEVELOPED from the experience of the world's largest wheel makers. Built of the finest material ever possible in steel wheels—high-carbon, one-piece forging. Far stronger, but consistently light. Simplest mounting—positive locking—single or dual. Greater load area, zero radial load, reduced torque load and over-strength studs assure highest safety factor. Convenient inflation. Easy cleaning. Permanent silence. Coolest operation proved in impartial tests! A bus and truck wheel with engineering and sales advantages now engaging the closest attention of great producers. MOTOR WHEEL CORPORATION, Lansing, Mich.

Building A Greater Chicago

ONE of the most remarkable achievements in electric railroading has been made by the managements of several Chicago interurban lines.

With pioneer courage they tapped practically virgin territory at a time when Chicago had room to expand for many years within its own boundaries.

Instead of waiting for business to slowly develop through natural growth, they sold the desirability of suburban residence to the public through super service.

Courtesy, frequent trains, and fast, comfortable equipment have been such inducements that a big paying, commutating patronage has resulted.

Foremost among these lines are the Chicago, North Shore and Milwaukee Railroad Co., the Chicago, South Shore and South Bend Railroad, and the Chicago, Aurora and Elgin Railroad Company. All these are enjoying the prosperity that comes through far-sighted management and super service. Westinghouse equipment predominates.

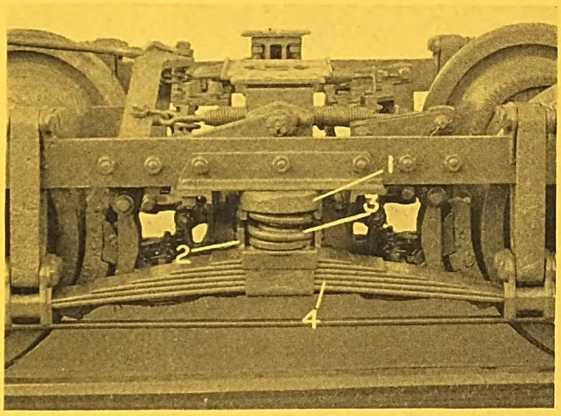
Riding Comfort—a contribution of

Brill Truck Design



Brill Graduated Spring System—

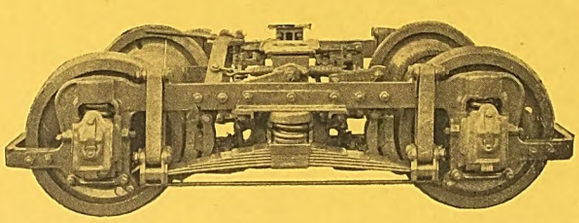
Assures equally good riding with varying passenger loads.

With a quick-acting coil spring (3) on top of a slower-acting semi-elliptic spring (4) under each end of the truck bolster, the former furnishes the necessary spring action when the carbody is empty or has a light load. When the load has increased to a point that the coil spring cap (1) formed on the bolster end contacts with the coil spring seat (2) the coil spring automatically goes out of action, and from that point on the necessary spring action is furnished by the heavier plate spring. Thus, equally good riding is obtained with both light and heavy bodies.

"Recommended by Proven Merit"

The **Brill 177-E Truck**, particularly designed for light-weight modern cars, includes a number of patented features which contribute much to its smooth and comfortable riding action. As riding comfort is an outstanding factor in attracting revenue passengers, the type of truck is of the utmost importance. Brill engineers have developed such patent features as the Bolster Guide, Graduated Spring System and Twin Links in their effort to obtain maximum truck efficiency, and the results achieved in improved riding comfort are a contribution to the success of modern electric cars.

Brill 177-E Truck



Described in Bulletin No. 306.

Illinois Central's Cars have G-E Compressors

The Illinois Central operates 130 of these multiple-unit cars on its recently electrified section. Each of these cars is equipped with a General Electric CP-30 1500-volt compressor and a Type ML air compressor governor.

The Illinois Central is one of the many roads which have learned that G-E compressors deserve their reputation for dependability.

General Electric has been identified with the electric railway industry since its inception. The experience gained in these 40 years is built into every piece of equipment that carries the G-E monogram.

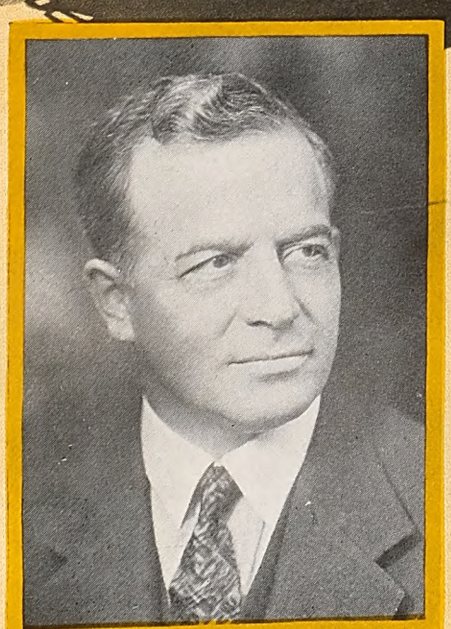
"Sweeping an Industry"



FRANK R. FAGEOL

Designer and originator of Street Car Type Twin Motored Coach, carrying 80 to 110 passengers.

We believe coaches with motors forward will hereafter be looked upon as old fashioned. Why should engines use up passenger capacity and waste street space?

As always Frank R. Fageol is the leader in coach transportation—again his Twin Coach demonstrates this often spoken truth

TWIN COACH CORPORATION

KENT, OHIO

Protection

against extreme conditions

TO shoot through the clouds, a hundred miles an hour or more, the aviator needs special protective dressing—ordinary clothes won't do.

Railway motors also operate under conditions that call for more than "save-the-surface" varnish for insulation.

To effectually resist the vibration, the moisture and the extremes of heat and cold, the insulating varnish must have special characteristics. Westinghouse varnish No. 335 has those characteristics. This special varnish is an important factor in Westinghouse motor performance. Keep it on hand for any motor insulation that may become necessary from time to time. You can buy it by the can.

No. 201-B-1 Type

A Seat Worthy of the 1928 Model Car

Throughout the development of its design and influencing the selection of every piece of equipment on the Brill 1928 Model Electric Car was one particular thought—a type of car which would measure up in every way to the demand for a more attractive public conveyance.

Consequently, the Brill No. 201-B-1 was selected to contribute its part in obtaining desired results.

Deep spring leather upholstered cushions, a semi-individual type back pitched back to a most comfortable degree, and a simple yet positive reversing mechanism which suggests minimum maintenance in long and satisfactory service. The Brill No. 201-B-1 Seat is certainly worthy of this latest development in electric cars —the Brill 1928 Model.

Lake Bluff Automatic Substation of the Chicago, North Shore & Milwaukee. In operation since February, 1919.

—built to endure

The unvarying good performance of the original automatic substations of the Chicago, North Shore & Milwaukee Railroad indicates that G-E Automatic Equipment is built to endure. The first was placed in operation in 1917 and its probable length of life is still for the future to determine.

The "North Shore's" growing list of automatic substations and its present program of installing automatic equipment in manual stations attest this company's confidence in G-E Automatics.

The G-E Automatic Equipments being built today are still further improved over those that are in regular operation after ten years of continuous service.

Three years before the Chicago, North Shore & Milwaukee adopted automatic control, the first automatic substation (G-E) was put into operation. This station is one of the several G-E Automatics that have been in service 10 years or more.
